Profile

Senior Software Engineer with 10+ years of experience building real-time, user-focused platforms across automotive, fintech, and healthcare. Led key projects at Ford, Stripe, and UnitedHealth Group, delivering scalable systems used by thousands of users. Strong in both frontend and backend, with a focus on performance, clean UI, and working well across teams.

Skills

JavaScript, TypeScript, React, Angular, Vue.js, Next.js, Context API, Redux, Node, Java, Spring Boot, RESTful API, GraphQL, WebSocket, MySQL, MongoDB, PostgreSQL, DynamoDB, Jest, Cypress, AWS, GCP, Docker, Kubernetes, Redis, GitHub Actions, Jenkins

Professional Experience

Senior Software Engineer, Ford

Mar 2021 – Present

- Led frontend development of key modules in the Vehicle Health Dashboard, enabling 150K+ Ford owners and fleet managers to monitor real-time DTC (Diagnostic Trouble Code) alerts, oil life, tire pressure, and service reminders via the FordPass app.
- Delivered resilient, streaming-ready UI components in React and TypeScript, working closely with firmware and product teams to support vehicle modem latency, offline states, and varying data formats across 12+ models.
- Partnered with backend engineers to integrate a WebSocket-based pipeline using Java, Redis Streams, and RxJS, ensuring smooth telemetry updates even under 5K+ event bursts per second.
- Helped design and integrate a shared DTC decoding service with Java and Redis so drivers and service techs could actually understand what the fault codes meant.
- Improved UI performance across garage tablets and mobile devices by reducing load time by 32%, applying bundle optimization, device-specific fallbacks, and code splitting strategies.
- Built fault ingestion and alerting features that run on GCP Cloud Run, using Pub/Sub for real-time streaming, and applied IAM (Identity and Access Management) for scoped access to fleet and vehicle data.
- Wrote and maintained over 200 automated tests using Jest and Cypress, ensuring reliability across edge cases like offline vehicles, partial telemetry, and outdated firmware.

Senior Software Engineer, Stripe

Sep 2016 – Feb 2021

- Architected financial account dashboards for Stripe Treasury with React and Apollo that enabled businesses to manage over \$15B in monthly funds across Treasury-linked accounts.
- Engineered onboarding flows using React and Apollo GraphQL to streamline KYC verification and bill pay setup, allowing thousands of businesses to activate embedded finance features efficiently.
- Implemented backend services in Java to handle financial account provisioning, ACH and wire payments, and real-time fund transfers, scaling throughput to 500K transactions per hour via NSQ (Nanosecond Queue).
- Simulated complex money movement workflows using Java and NSQ to validate edge cases in funding, holds, and payouts, accelerating QA throughput and reducing pre-release issues.
- Orchestrated service deployment with Docker on AWS to maintain sub-200ms API latency and 99.99% availability for mission-critical Treasury operations.
- Enforced code quality and deployment reliability across a 25+ engineer organization through rigorous GitHub review practices and CI/CD ownership.

Software Engineer, UnitedHealth Group

May 2014 – Aug 2016

- Contributed to the Provider Portal Modernization, upgrading key legacy healthcare apps used by providers.
- Rewrote legacy jQuery features into modular AngularJS components for better maintainability and frontend consistency.
- Built responsive, accessible UIs using AngularJS, Bootstrap, and custom form validations for cross-device support.
- Helped implement RESTful APIs in Java (Spring MVC) to modernize claims tracking and eligibility verification.

Education

Bachelor's Degree in Computer Science,
Georgia State University

2010 – 2014
