

Joshua Austin

Senior Software Engineer

Overview

Innovative and passionate software engineer with over 10 years experience of full-stack web application development primarily focusing on C#/.NET and related Microsoft technologies.

Equally comfortable with starting new projects from scratch or taking over responsibilities of existing codebases. Successfully developed several complex projects throughout the entire software development lifecycle.

Core Competencies:

- Ability to work independently as a sole developer or effectively collaborate with fellow software engineers, QA teams, UI/UX developers and graphic designers
- Demonstrated ability to take user requirements and translate them into effective software solutions
- Proven experience as technical team lead including mentoring junior developers

Experience

Senior Software Engineer at Revecore

March 2024 — Present

Contracted to address critical issues, optimize insurance and financial systems, and uphold existing systems. Currently engaged in implementing and sustaining a dynamic rules engine for intricate insurance regulations and collaborating with large relational databases.

Senior Software Engineer at Epsilon

February 2021 — February 2024

Full-time senior developer role.

Primary responsibilities included maintenance, upgrades and migration of legacy projects. Heavily involved with migration of a large project from Azure to AWS, including hosting, authentication services, CI/CD pipelines, etc. Also played a significant role in developing microservices managed with Docker.

Other responsibilities included developing new web apps using React, .NET Core and MS-SQL Server. Jira was used for project management and Github was used for source control. Worked very closely with QA, UI/UX and product development teams.

Senior Software Engineer at Microsoft

September 2020 — March 2021

Contract position for a self-contained project with many interworking components.

Primarily focused on the 2022 Game Developer Conference event page - <https://developer.microsoft.com/en-us/games/> as well as the related Game Server Pricing Calculator and some other related web applications.

Related technical details include:

- React, Redux, Sass, CSS, Sharepoint, Amazon Experience Manager, and Javascript were used to develop the UI of the application

MSSQL
MYSQL
PostgreSQL
MongoDB
Redis
Docker
CI/CD
DevOps
Jenkins
Microservice
Amazon Web Service
Azure Devops
RabbitMQ

- ASP.NET MVC and MS-SQL Server were used to build backend features for the application
- All tasks were managed on Azure
- Applications were staged on Azure and Jenkins with continuous delivery

Senior Software Engineer at Citi, Fairfax, VA

July 2020 — January 2021

Contracted to develop Citi's Build Readiness, Launch Readiness (BRLR) web application. This was a business-facing web application. Responsibilities primarily included writing new C#, Javascript and SQL code. Most development time was geared towards new features of existing applications as well as brand new applications.

Related technical details include:

- C#, .NET Core, Entity Framework, Azure and MS-SQL Server were used to build backend features for the application
- React, Redux, Sass, CSS, and Javascript were used to develop the UI of the application
- Docker was used to manage microservices
- All tasks were managed on Jira
- Applications were staged on Github and Jenkins with continuous delivery

Senior Software Engineer at Domino's, Ashburn, VA

March 2020 — August 2020

Contract work related to several projects for dominos.com including:

- An automated chatbot with live agent support
- Redesign of their checkout page
- Redesign of the delivery map and tracker

Worked with a small team of other developers to integrate our redesigns into the existing architecture. Most of the work involved writing new Angular, Sass and CSS code for the front end. C# & MS-SQL Server powered the back end and required a significant amount of custom queries to be written. Google Maps API was used for all of the GIS features of the delivery map portion of the app.

Full Stack Developer at Cypress.io, Evans, GA

July 2019 — March 2020

Hired and contracted to develop several projects for entities such as the US Air Force, NSA, and Carbon Reach including:

- A web application for airplane maintenance
- A phone app for the NSA
- A phone app for Carbon Reach

Worked closely with a small team of developers to write, test and deploy all the code required to get these apps fully functional. A great deal of care was needed for reliability and resiliency.

Technical:

- React, Redux, Redux, Sass, JSS, and CSS forms were used to build out the UI of the Air Force's maintenance application
- Node.js, ASP.NET, and Xamarin were used to build out the API for all of the projects
- Angular Google Maps was used to create features for the delivery tracker
- Xamarin was used to build out the phone applications
- All tasks were managed on Jira and Pivotal Tracker
- Applications were staged on Gitlab, Kessel Run, and Concourse with continuous delivery
- Docker was used to manage microservices

Full Stack Developer at Randstad Technologies US, Augusta, GA

July 2018 — July 2019

Assigned to work on various projects for the Center of Medicaid's employee site:

- Video player/library with voice controls for disabled users
- A support chatbot for the application engineered voice controls
- A portal page with 2-factor authentication

Worked with a medium-sized team of developers to develop these apps. Accessibility and security were a big focus on this project. Primary responsibilities included developing, testing and deploying new code as well as managing the hosting environments.

Technical:

- Angular 7, React, and Redux, SCSS, and CSS were used to build out the UI of the CMS
- Node.js, ASP.NET, and OAuth2 were used to develop the API for all of the projects with MS-SQL Server
- DialogFlow CX, Amazon Lambda, and Amazon Lex were used to create the chatbot
- Amazon S3 was used to host videos and static staging site files
- All projects had to be 508 compliant
- All tasks were managed on Jira
- Docker was used to manage Microservices
- Applications were staged on Jenkins with continuous delivery

Full Stack Developer at HHS, LLC, Houston, TX

February 2017 — June 2018

Hired to develop several projects for an application called Intra, an enterprise-level SAAS with many monthly users. These projects included:

- Asset/mail tracking web application
- Asset/mail tracking API
- Smart mailroom lockers that utilized video, devices, and deep learning technology

Involved in just about every aspect of this project, working with a medium-sized team. Wrote a large portion of the new code these apps used. Also played a large role in project management and product development. Needed to interact effectively with a large variety of different departments with varying levels of technical proficiency.

Technical:

- React and Backbone.JS, ASP.NET, jQuery, Javascript, SCSS, and CSS were used to build out UIs
- ASP.NET, C#, and Visual Basic were used to develop the API
- Deep learning models were trained using Python, Jupyter Notebook, MXNet, Tensorflow, Amazon Sage in AWS console
- OCR, and image processing were used to read text off shipping labels
- Amazon Deep Lens and IoT Buttons were used with Lambda functions on smart lockers
- All projects had to be 508 compliant
- All tasks were managed on Azure Devops
- Applications were staged on Azure Devops
- UIs were designed from images generated in Sketch, Adobe XD, and Adobe Photoshop

Full Stack Developer at Tricentis, Austin, TX

October 2014 — February 2017

Hired and promoted to Lead and Developer for applications that simplified machine learning for non-developers:

- Tricentis Analytics Tools for UAV/ArcGIS (Simplified Machine Learning on Map Data)
- Tricentis Analytics Tools for Machine Health (Simplified Machine Learning on Wave Data)
- Tricentis Analytics API

Worked with a small team of developers to develop various projects from start

to finish. Was responsible for doing code reviews and creating guidelines & best practices for the overall system architecture.

Technical:

- Angular 1/2, React, D3, Javascript, SCSS, and CSS were used to build out the UI of the Machine Health application
- C#, ArcObjects, ArcMap API for Javascript, Python, ArcPy, ArcMap 10.4/10.5, and ArcScene were used to create the front end of the UAV/ArcGIS tools
- Node.js was used to build the API with MongoDB
- Machine Learning API was hosted on an in-house Linux server
- Scikit-learn, MxNet, Tensorflow, Matlab, OpenCV, C++, C#, Python, and DLLs were used to create the machine learning functions
- UIs were designed from images generated in Adobe XD, and Sketch
- All projects had to be 508 compliant
- All tasks were managed on Jira
- Applications were staged on Github with continuous delivery

Software Engineer at Understand.com, Reno, NV

April 2012 — October 2014

- Developed a single-page application using .NET MVC, HTML / CSS, C#, jQuery, Knockout.js, NHibernate and MS-SQL Server that displays interactive 3D anatomical structures, images and videos along with an in-depth content editor
- Involved in all aspects of CD-ROM / USB products which are an offline version of the company's web-based services
- Worked closely with the Vice President of Technology to create an advanced browser-based platform using .NET Web Forms as well as .NET MVC with C#, MS-SQL Server, NHibernate and jQuery to manage all company content, data and customization including a customer portal, in-depth sales reporting and more
- Involved with computer hardware and networking, media production, audio editing, localization and content management

Education

University of Nevada, Reno

Bachelor Degree

May 2007 — July 2011
