

Raviteja Velicheti

Sr. RPA Developer

Automation Anywhere | UiPath | Python | GenAI

Ph: +1 (904) 679-8919

ravitejavelicheti1992@gmail.com

[linkedin.com/in/ravitejavelicheti1992](https://www.linkedin.com/in/ravitejavelicheti1992)

Professional Summary:

- Professional, detail-oriented, and result-driven RPA Senior Developer with 8+ years of experience designing and implementing end-to-end automation solutions using Automation Anywhere and other RPA tools.
- Expertise in automating business processes, reducing manual effort, and ensuring operational excellence across various industries.
- Proficient in gathering business requirements, conducting feasibility assessments, and identifying the most suitable automation tools for process optimization.
- Skilled in creating comprehensive process documentation, including PDDs and SDDs, to ensure clarity and alignment with business objectives.
- Skilled in integrating RPA solutions with enterprise systems, REST APIs, and OCR tools (ABBYY, Tesseract).
- Experience in bot lifecycle management, performance optimization, and compliance with IT security standards.
- Adept at estimating development efforts and providing detailed timeframes for successful project delivery.
- Strong ability to collaborate with stakeholders, manage change requests, and ensure successful bot deployment.
- Proficient in integrating RPA tools with various enterprise systems, ensuring smooth and scalable automation implementations.
- Proven ability to mentor teams, collaborate with stakeholders, and deliver scalable, efficient RPA workflows.

Technical Skills:

Technologies	Details
RPA Tools	Automation Anywhere, UiPath, Power Apps,
Languages	Python, VBScript, SQL
OCR Tools	ABBYY, Tesseract
Database	SQL Server, MySQL
Integrations	REST APIs, SOAP APIs

Professional Experience:

Project #1 Project: Invoice To Posting

June 2024 - Present

Client: Mars

Role: Sr. RPA Developer

Project Description: Mars Petcare is a global leader in pet nutrition and health, dedicated to improving the lives of pets and pet parents. With a diverse portfolio of brands like Pedigree, Whiskas, and Royal Canin, the company provides high-quality pet food and care products. Mars Petcare also invests in innovation, including veterinary services and technology solutions, to promote pet well-being. Committed to sustainability, the company focuses on creating a better world for pets and the planet.

Responsibilities:

- Collaborated with business stakeholders to gather and analyze requirements, ensuring alignment with organizational goals.
- Conducted feasibility studies to evaluate the automation potential and identified process improvement opportunities.
- Designed and developed end-to-end RPA solutions, automating processes in **SAP, One Navision, Excel, and web-based applications**.
- Prepared and documented **Process Design Documents (PDD)** and **Solution Design Documents (SDD)**, ensuring detailed process mapping and technical specifications, and obtained necessary sign-offs from stakeholders.
- Created and tested reusable components to streamline development efforts and enhance scalability.
- Prepared and executed **UAT (User Acceptance Testing) cases**, ensuring the accuracy and efficiency of automation processes.
- Incorporated feedback from business teams to refine and optimize automated workflows.
- Utilized **ABBYY Vantage** for data extraction from invoices, integrating advanced OCR capabilities into automation solutions.
- Integrated **Python scripts, JavaScript functions, Excel Macros, and PowerShell scripts** with **RPA workflows** to enhance functionality and expand automation capabilities.
- Integrated **Power BI** with RPA systems using APIs to monitor bot triggers and provide real-time insights into performance.
- Managed code movement to the production environment, ensuring stability and compliance with deployment standards.
- Conducted knowledge transfer sessions to support teams, ensuring smooth handover and ongoing maintenance of automation solutions.
- Automated invoice processing in SAP and One NAVision, reducing manual effort and increasing accuracy.

Environment/Tools: Automation Anywhere, SQL Server, ABBYY OCR, Python, REST API

Project #2 Client: MARS | Project: Service Now Ticket Classification Aug 2023 – May 2024

Client: Mars

Role: Sr. RPA Developer

Project Description: Developed an RPA solution to automate the ticket assignment process in ServiceNow. The bot analyzes the categorization and priority of incoming tickets, ensuring they are rerouted to the appropriate teams for faster resolution. Additionally, the bot acknowledges users by sending automated email responses to confirm receipt of their tickets.

Responsibilities:

- Designed and implemented RPA bots to analyze incoming **ServiceNow** tickets, checking their categorization and priority levels.
- Automated ticket routing based on predefined rules to ensure tickets are assigned to the correct teams for timely resolution.
- Developed email notification workflows to automatically acknowledge users and confirm receipt of their tickets.
- Ensured efficient integration of RPA bots with ServiceNow to streamline the ticket assignment and tracking process.
- Performed thorough testing and validation of the bot's functionality, ensuring accurate categorization, routing, and communication.
- Collaborated with stakeholders to define business rules for ticket prioritization and categorization.
- Monitored bot performance and optimized processes to improve accuracy and reduce response time for ticket resolutions.

Environment/Tools: UiPath, ServiceNow, SQL Server, REST APIs, Power Bi

Project #3 Data Reporting of Raw Material and packaging of concessions. Oct 2022 – Aug 2023

Client: Mars

Role: Sr. RPA Developer

Project Description: This project involved extracting concession data from the Nexus application across more than 20 locations and integrating it into a dashboard for managing deviations from specifications. Each concession has multiple phases, with the possibility of moving back and forth between phases. The digital worker identifies these phase changes, generates a report for the customer, and retrieves updated data once the customer populates any missing information.

The bot then loads the updated data into a database, which is reflected in the Power BI dashboard.

Responsibilities:

- Contributed to the creation of **process documentation (PDD)** for the use case, ensuring comprehensive understanding of the workflow.
- Developed and documented test procedures and scenarios for the Pre-UAT phase, supporting operational teams during UAT and rollout.
- Handled change requests and incorporated necessary modifications to automation workflows.
- Developed email notifications and custom exception handling to manage errors and ensure smooth operations.
- Responsible for debugging and resolving code issues, ensuring the bot runs efficiently.
- Configured automation processes according to the Solution Design Document (SDD), ensuring consistency and adherence to requirements.
- Assisted in creating a customized **Power BI** dashboard for real-time data reporting and visualization for the customer.
- Developed and implemented the end-to-end process, including the automation of data extraction from the Nexus application.

This version keeps the language professional and focuses on the impact of your contributions to the project. Let me know if you'd like to further refine any aspects!

Environment/Tools: UiPath, Salesforce, SQL, Python, REST APIs

Project #4 Legal Proposal Check

Oct 2021- Sep 2022

Client: Mars

Role: Sr. RPA Developer

Project Description: To develop an automated bot that will review legal proposals (received in PDF, Word, and PowerPoint formats) and highlight key terms or phrases based on a predefined set of keywords. The bot will extract these highlighted terms from the proposal and send the processed document back to the user through an email shared mailbox.

Responsibilities:

- Create functionality for the bot to handle and parse multiple document formats, including PDF, Word (.docx), and PowerPoint (.pptx).
- Ensure accurate extraction of text content from each format, including handling complex structures like tables, footnotes, and headers/footers.

- Integrate a predefined set of keywords related to the legal field (e.g., clauses, legal terms, specific references, etc.).
- Implement a robust text search algorithm to scan through the document and identify matches for the predefined keywords.
- Highlight the matched keywords within the document. This may require formatting changes or adding annotations in the original document, depending on the file format by integrating VB Script in RPA Bot.
- Developed a functionality that sends the processed document back to the user via the shared mailbox.

Environment/Tools: Automation Anywhere, Salesforce, SQL, Python, REST APIs

Project #5 Recovery Review

Nov 2020- Sep 2021

Client: State Farm

Role: Sr. RPA Developer

Project Description: To develop an automated RPA bot that will review and process recovery claims for an insurance company. The bot will collect and validate recovery data from multiple systems, ensuring compliance with business rules and policy terms. It will automatically flag discrepancies or exceptions, trigger appropriate alerts for human review, and generate necessary documents such as recovery confirmations or payment instructions.

Responsibilities:

- Create functionality for the bot to handle and parse multiple document formats, including PDF, Word (.docx), and PowerPoint (.pptx).
- The bot gathers all relevant data (e.g., claim numbers, recovery details) from various internal systems or external sources. It then validates the recovery information by cross-referencing it with policy details, settlement records, and business rules to ensure accuracy and compliance.
- If discrepancies or exceptions (e.g., invalid amounts or non-compliance) are identified, the bot triggers alerts and escalates cases to human supervisors for further review. Non-exception cases proceed automatically to the next step.
- The bot automatically retrieves necessary documents (e.g., policy terms, settlement letters) and generates any required paperwork, such as recovery confirmation or payment instructions, to complete the process.
- Once the recovery is approved, the bot updates the insurance system with the finalized recovery details (e.g., amounts, status) and initiates any necessary payment processing, such as generating payment instructions.
- The bot generates regular or ad-hoc reports to track recovery performance, such as recovery amounts, timelines, and exceptions, providing insights into process efficiency and opportunities for improvement.
- After completing all tasks, the bot finalizes the recovery case, marking it as resolved and archiving all relevant information for future reference or auditing purposes.

Environment/Tools: Automation Anywhere, SQL

Project #6 Invoice Digitization

Jan 2020- Oct 2020

Client: Accenture

Role: Sr. RPA Developer

Project Description: To develop an automated RPA bot that will review and process recovery claims for an insurance company. The bot will collect and validate recovery data from multiple systems, ensuring compliance with business rules and policy terms. It will automatically flag discrepancies or exceptions, trigger appropriate alerts for human review, and generate necessary documents such as recovery confirmations or payment instructions.

Responsibilities:

- Configure the bot with necessary credentials for the airline portals (Air India, Indigo, SpiceJet) and the Amazon S3 bucket (API keys, login credentials, S3 access keys, bucket name).
- The bot logs into each airline portal using provided credentials and navigates to the invoice section.
- The bot searches for the invoices by invoice number and date range and downloads them in the pdf format.
- The bot checks the integrity of the downloaded files and renames them using a standard naming convention (e.g., invoice number, airline, date).
- The bot uploads the downloaded and renamed invoices to the designated Amazon S3 bucket.
- After uploading, the bot creates a report summarizing the invoices processed, including any failed downloads or uploads.
- Ensure smooth operation with error management and maintain an audit trail for compliance.

Environment/Tools: UiPath, Amazon S3, SQL

Project #7 Employee Onboarding

May 2019- Dec 2019

Client: Accenture

Role: Sr. RPA Developer

Project Description: The RPA bot automates the employee onboarding process by creating user IDs and Active Directory (AD) IDs, assigning roles based on designation and skills, and setting up necessary system access. It also sends personalized welcome emails, adds employees to relevant groups, and generates confirmation reports. This automation ensures a smooth, error-free onboarding experience for new hires.

Responsibilities:

- The bot collects essential employee information (name, email, designation, skills) from an HR system or onboarding portal.
- The bot generates a unique user ID and creates the corresponding AD ID in the company's Active Directory system. It also sets up the employee's login credentials.
- Based on the employee's designation and skill set, the bot assigns predefined roles (e.g., Admin, User) and grants appropriate system access (tools, applications, email groups).
- The bot sends a personalized email containing the employee's user ID, AD ID, and temporary password, along with first-login instructions.
- The bot adds the new employee to relevant email groups, communication channels (e.g., Slack), and department-specific tools.
- The bot logs each step (user creation, role assignments, email sent) and generates a confirmation report for HR or IT departments.

Environment/Tools: Automation Anywhere, SQL

Project #8 Employee Modification

Aug 2018- Apr 2019

Client: Accenture

Role: Sr. RPA Developer

Project Description: The RPA bot automates the process of modifying employee user IDs by updating roles, permissions, and group memberships based on modification requests. It authenticates the user, performs the required changes, and notifies the employee and relevant stakeholders. Additionally, it generates audit logs and confirmation reports for compliance and tracking purposes.

Responsibilities:

- The bot receives the modification request (roles, permissions, groups) from HR, email, or service management tools and validates the user's details.
- The bot cross-checks the employee ID against the Active Directory to ensure the employee exists.
- Based on the request, the bot updates the user's roles or groups and adjusts system permissions.
- The bot adds or removes the employee from relevant groups (e.g., department-specific groups, email lists).
- The bot sends a notification to the employee confirming changes and alerts relevant stakeholders (HR) about the updates.
- The bot creates an audit log of the changes and generates a confirmation report for HR for record-keeping and compliance.
- This process ensures efficient, error-free handling of user role and group modifications.

Environment/Tools: Automation Anywhere, SQL

Project #9 Employee Off-Boarding

Aug 2017- Jul 2018

Client: Accenture

Role: Sr. RPA Developer

Project Description: The RPA bot automates the employee offboarding process by revoking system access, disabling user accounts, and retrieving company assets. It updates HR and IT records, ensuring that all offboarding tasks are completed on time and securely. Additionally, the bot sends exit communications and generates final clearance reports for compliance.

Responsibilities:

- The bot receives the modification request (roles, permissions, groups) from HR, email, or service management tools and validates the user's details.
- The bot cross-checks the employee ID against the Active Directory to ensure the employee exists.
- Based on the request, the bot updates the user's roles or groups and adjusts system permissions.
- The bot adds or removes the employee from relevant groups (e.g., department-specific groups, email lists).
- The bot sends a notification to the employee confirming changes and alerts relevant stakeholders (HR) about the updates.
- The bot creates an audit log of the changes and generates a confirmation report for HR for record-keeping and compliance.
- This process ensures efficient, error-free handling of user role and group modifications.

Environment/Tools: Automation Anywhere, SQL

Project #10 Service Now Ticket Creation

Nov 2016- Jul 2017

Client: Marathon

Role: RPA Developer

Project Description: This RPA bot automates the process of creating ServiceNow tickets for RPA bot-related issues or changes by extracting information from emails, validating the data, categorizing the request, and creating tickets in ServiceNow. It also sends acknowledgment emails and logs the ticket creation for compliance and tracking.

Responsibilities:

- The bot continuously monitors a designated email inbox (shared mailbox) for incoming emails related to issues or changes for the RPA bot.
- The bot uses an email template format to extract relevant information from the incoming email (e.g., issue description, priority, requester name, and Process Name).
- The bot validates the extracted data (e.g., ensuring no missing fields like description or priority). It categorizes the request (e.g., Issue, Change, Request for Information) based on keywords in the email or a predefined mapping.
- The bot logs into ServiceNow, fills in the required fields (e.g., short description, priority, description, requestor information, category), and creates the ticket in the ServiceNow system.

- The bot associates the created ServiceNow ticket with the appropriate user and support group based on the request type.
- The bot sends an acknowledgment email to the requester, confirming the ticket creation and providing the ticket ID for tracking.
- The bot logs the ticket creation details (e.g., ticket ID, date, issue summary) in an internal log or dashboard for tracking purposes.

Environment/Tools: UIPath, Service Now, SQL
