SUMMARY

A seasoned Backend Engineer with extensive experience in developing and optimizing server-side applications. Skilled in C#, ASP.Net, and serverless architectures using AWS Lambda and Azure Functions. Successfully enhanced backend processes for improved performance and efficiency in various projects. Eager to leverage backend expertise to drive robust and scalable solutions in the target role.

SKILLS

- **Frontend Languages:** HTML, CSS, Bootstrap, Angular 8 +, Material UI, React, Redux, ngRx and micro-frontends.
- **Backend Languages:** ASP .Net MVC, ASP.NetCore, Serverless Applications, Azure Functions, Redis, AWS lambda, Azure CI/CD, pipelines, Third Party APIs, Apache Kafka, RabbitMQ, Entity Framework, Dapper, ADO.NET, Microservices
- **Tools:** Visual Studio, VS Code, Git, AWS console, Postman, Swagger, SSMS, Jira.
- **Cloud Platforms:** Azure (ACR, AKS, Functions, Service Bus, AppInsights, Data Factory, Key Vault, Azure App Service, Blob Storage, Entra ID), AWS (SQS, EC2, RDS, DynamoDB, Elastic Cache, ECS, EKS, ECR, S3, CloudFront, CloudWatch)
- **Testing:** Microsoft Unit testing, NUnit, XUnit
- **DevOps:** Azure DevOps, GitHub Actions, Jenkins, Docker, Kubernetes, Terraform, Pulumi
- **Data Visualization/Engineering:** DataTables, Power BI
- **Project Management Tools:** Jira, Azure, Github, GitLab

WORK EXPERIENCE

Senior Backend Software Engineer | iHoriozons

02/2024 – 01/2025

- Added modules for aftermarket and OEM parts management.
- Made backend changes to improve the efficiency of data fetching procedures.
- Enhanced site performance through C# and SQL optimizations.
- Managed client-specific feature enablement for multiple websites via admin panels.
- Developed modules for dynamic proposal and quote generation for security audit firms and other businesses.
- Worked on admin-side features for editing estimates, managing discounts, and user management.
- Enhanced UI with drag-and-drop lists and text editor upgrades using Telerik and Kendo UI components.
- Fixed front-end bugs and optimized backend processes for improved performance.

Project: Vin-Data

- Customer Site management that hosts settings and features of multiple websites for multiple clients. Admin could enable/disable different features according to plans decided by clients.

-
- **Tools & Technologies:** C# .NET, SQL
 - **Role & Responsibilities/Task Completed:** Dealt with multiple back-end changes and bugs in C# and SQL. Performance Completed upgrades to the site. Added modules for aftermarket and OEM parts. Changes to data fetching procedures to make processes more resource-efficient.

Project: RTNewdayCostsheet

- The web application that deals with multiple user requests for proposals and quotes for different businesses. The user side of the application can select multiple options according to their business, e.g. security audit firm in which the user selects different options according to case/ scenario and the application gives an estimate after multiple calculations.
- **Tools & Technologies:** ASP.NET MVC, HTML, JavaScript, SQL
- **Role & Responsibilities/Task Completed:** Worked on multiple front-end bugs and added modules like list drag and drop Completed and text editor upgrades with kendo and Telerik UI components. Also added modules for the back end and enhanced the performance of the application.

Full Stack Engineer | I-O Urology

03/2023 – 01/2024

- Developed Azure functions from scratch with different triggers, integrating third-party APIs making gateway APIs, and writing multiple micro services.
- Created an angular app for the UI of the app with material UI and nebular theme to create a pleasant and smooth UI for the client and the customers.
- Applied different authentication schemas and adding interceptors to make the app secure, added distributed non relation cache to make the app more responsive and currently implementing CQRS.
- Added User management, study and study type management and handles management to the App.
- Investigated and provided hot-fixes for bugs and escalated issues.

Project: I-O Urology

- A medical (urology) related app that monitors patient's data continuously through handles and maintains a history of multiple patients per health system. The App has a complete admin-side implementation to deal with Users, health systems, studies, and hardware. The app has a user side to deal with patients' data to maintain a history and to suggest medications.
- **Tools & Technologies:** C# .Net 6, Angular 13(Material UI, Nebular, Prime Ng), SQL, Azure Functions, Apache Kafka, Blob Storage, Azure Container Registry, Azure Kubernetes Service, Redis.

Senior Software Engineer | Nextbridge

04/2021 – 03/2023

- Developed a Windows Forms application for collecting vehicle data from multiple systems (Hollander/Powerlink, Pinnacle, and Checkmate).
- Enhanced performance for faster, smoother, and more efficient data collection and transfer to the cloud.
- Implemented data encryption and decryption for millions of rows of daily-transferred data.
- Enabled admin functionality to generate reports and FTP data files with enhanced tools and SQL-based solutions.
- Designed and developed an Angular application with a .NET Core backend for scanning software and hardware details of systems.

- Designed the UI and backend while exploring multiple system scanning solutions like Windows Registry and open-source tools.
- Collaborated with the project manager to ensure efficient, cross-platform functionality.
- Developed AWS Lambda functions as middleware to connect mobile apps with Kairos API via S3, SES, and triggers.
- Ensured seamless data exchange between mobile applications and the API using ADO.NET and ASP.NET.
- Optimized API lifecycle with extensive documentation and testing for robust performance.

Project: MIS (System Scanning Application)

- An Angular application with backend in .Net Core 3.1, this application deals with all of the system that are on company's network and scans them for their software and hardware details. Software scan get all the software related information. Hardware scan gets the hardware detail of the system e.g number of ram modules and ram installed, hard disk type, ssd, number of LEDs etc.
- **Tools & Technologies:** C# .Net Core 3.1, Angular 13(Material UI)
- **Role & Responsibilities/Task Completed:** The whole system was built by me through the guidance of my project manager. I designed the UI and the backend, worked on multiple solutions to scanning the system from windows registry to other free wares. The system is built for multiple platforms and can perform scan on Linux, Mac and windows hence made all three different scanning mythologies for different systems.

Project: Kairos API (Face Recognition Middleware)

- The app communicates with Kairos API to fulfil tasks. Our mobile application worked in conjunction with this API by enrolling, verifying, recognizing, comparing, and detecting multiple faces using Kairos. The Lambda function worked as middleware by connecting the two applications and providing to and fro data exchange throughout the whole process using S3 bucket, SES, and different types of triggers.
- **Tools & Technologies:** ASP.NET, ADO.NET, AWS Lambda, SQL
- **Role & Responsibilities/Task Completed:** Worked on the whole process of Kairos API, from API research and implementation to implementing the Lambda function and triggers with multiple cases included in the application's life cycle.

Software Engineer | Visionary Computer Solutions (VCS)

09/2019 – 03/2021

- Worked on an IoT project that included m5stack (Wi-Fi Soc, upgrade of ESP8266/ESP32) and integrated it with C# windows application.
- Transferred information using MQTT protocol.
- Programmed the device in multiple languages (Micro Python/C/m5stack UI Flow).
- Worked on the integration of Walmart API in web application based on C#.
- Completed integration of Microsoft Power BI in C# and VB web applications.
- Developed a web API for authorization and de-authorization of clients (C#).
- Built multiple serverless applications using AWS Lambda, CloudWatch, S3, SES, VPC, and IAM.
- Designed serverless workflows for data synchronization, email monitoring, SFTP transfers, and Sisense Dashboard integration.
- Built efficient and power-reserved LED solutions for streamlined token display.

Project: Wireless LED Token System

- A system of wireless LED displays that were integrated with an already existing application (hospital management system). There was a different LED for every single doctor and all of them were

connected to an API. Each display had power reserve and communicated through WIFI and was configurable as well.

- **Features:** Wireless, Efficient, Smart, Automated
- **Tools & Technologies:** C#, SQL, ESP32, MAX7299

Associate Software Engineer | Corvit Networks (PVT.) Ltd

08/2017 – 09/2019

- Worked on their IoT (internet of Things) project.
- Had hands-on experience of the hardware and software implementation.
- Worked in Web Development team and built their website.
- Worked on front-end and back-end development using ASP.NET MVC, JavaScript, and SQL.

Project: Multi Factor Authentication

- Web Application that deals with authentication of multiple third-party APP including Microsoft, Google, LinkedIn, Facebook, etc.
- **Tools & Technologies:** ASP.NET MVC, HTML, JavaScript, SQL
- **Role & Responsibilities/Task Completed:** Worked on the front end and back end of the project including the documentation, research, and flow/ lifecycle of the project.

EDUCATION

Bachelor's Degree in Computer Science

Punjab University College of Information technology (2014-2018)
