

ANTHONYN UCHE, Principal Cloud Engineer

Texas, Dallas , 75052, United States, +1-469-275-0525 , Cauche3103@gmail.com

Nationality	United State
-------------	--------------

PROFILE	Cloud is the backbone of modern business innovation, not just IT infrastructure. I build resilient, automated, and security-first cloud ecosystems that support high-performing applications, reduce operational complexity, and enable faster business transformation. My expertise lies in implementing scalable, highly available, and cost-optimized solutions on AWS, Azure, and Google Cloud Platform (GCP). For the past ten years, I have been the driving force behind enterprise-wide cloud modernization initiatives. At IBM, I led the migration of business-critical workloads to AWS and Azure, using Terraform and AWS CloudFormation to design and implement fully automated and self-healing infrastructure. I developed and executed multi-cloud strategy and automation, ensuring seamless cloud integration. To enhance security, I introduced the concept of Zero Trust security models, implementing IAM, AWS Security Hub, Azure Sentinel, and Google Cloud Security Command Center to safeguard cloud environments against emerging threats. By applying CI/CD pipelines with Jenkins, GitHub Actions, and ArgoCD, I maximized system availability, reduced deployment time, and ensured seamless application delivery across hybrid cloud environments. At Accenture, I was responsible for enterprise cloud security and compliance automation. I developed NIST, ISO 27001, and SOC 2-compliant cloud governance frameworks to secure multi-cloud networks and eliminate security blind spots. I built automated security audits and policy enforcement pipelines using Ansible, Terraform, and AWS Config to maintain continuous compliance and risk mitigation. As the lead architect for high availability solutions, I designed and implemented AWS Global Accelerator, Azure Traffic Manager, and multi-region disaster recovery strategies, ensuring uninterrupted business operations. At Cognizant, I led the transformation of legacy monolithic applications into cloud-native microservices, utilizing Kubernetes (EKS, AKS, GKE), Docker, and OpenShift to enhance scalability and resilience. I deployed a GitOps-based CI/CD automation model using Jenkins, Helm, and FluxCD, enabling fully automated and secure software releases. To optimize cloud networking and security, I designed AWS VPC peering, Azure Virtual WAN, VPN tunnels, and complex BGP-based routing strategies, improving performance and security posture across cloud environments. Beyond technical execution, I am a trusted advisor and strategic leader who drives best practices in DevOps, SRE, and security automation. I stay ahead of industry trends, integrating AI-powered cloud automation, FinOps-driven cost optimization, and blockchain-based security solutions to future-proof cloud infrastructures. My mission is clear to build intelligent, self-healing, scalable, and secure cloud ecosystems that empower businesses to thrive in the digital era.

EMPLOYMENT HISTORY	
Apr 2020 — Present	Principal Cloud Engineer , IBM Dallas, TX Challenge: Implementing Secure Multi-Cloud Solutions • The Problem: IBM needed a unified multi-cloud strategy across AWS, Azure, and Google Cloud, ensuring data security, regulatory compliance, and operational efficiency. The existing setup lacked robust security controls, leading to potential data exposure risks. • The Solution: I led the design and implementation of a multi-cloud security framework, integrating Zero Trust models and compliance automation using Terraform, AWS Security Hub, Azure Sentinel, and GCP Security Command Center. I automated security policies and real-time threat detection, ensuring consistent security enforcement across cloud environments. • The Impact: IBM now operates a fully compliant, scalable, and secure multi-cloud infrastructure, mitigating cyber threats while enhancing business agility. Challenge: Enhancing Cloud Infrastructure Automation • The Problem: IBM's cloud provisioning was manual and inconsistent, leading to delays, misconfigurations, and security vulnerabilities. • The Solution: I led the transition to Infrastructure as Code (IaC), leveraging Terraform, AWS CloudFormation, and Ansible to automate cloud infrastructure deployment. I enforced CI/CD pipeline integration to ensure security best practices in every deployment. • The Impact: Deployments that once took days are now fully automated, ensuring faster rollouts, standardized configurations, and improved security posture.

Challenge: Optimizing Cloud Security and IAM Governance

- **The Problem:** IBM had excessive **privileged access**, leading to **identity mismanagement risks** and **compliance challenges**.
- **The Solution:** I restructured **Identity and Access Management (IAM)** policies, integrating **AWS IAM, Azure Active Directory, and Okta** to enforce **Just-In-Time (JIT) access controls**. I also introduced **automated security governance** using **policy-as-code** for real-time **privilege monitoring**.
- **The Impact:** IBM's **cloud security posture** was significantly improved, **eliminating unnecessary privileges** and enhancing **access control enforcement**.

Challenge: Cloud Cost Optimization and FinOps Strategy

- **The Problem:** Cloud expenses were **escalating due to inefficient resource allocation and lack of cost visibility**.
- **The Solution:** I spearheaded **FinOps methodologies**, integrating **AWS Cost Explorer, Azure Cost Management, and GCP Billing API** for **real-time cost tracking** and **automated resource scaling**. I established **cost governance policies** and **optimized reserved instance purchasing**.
- **The Impact:** IBM now maintains a **cost-efficient, high-performance cloud strategy**, minimizing **unnecessary cloud spend**.

Challenge: Implementing Kubernetes and Container Orchestration

- **The Problem:** IBM's **containerized applications** faced **scalability and security challenges** due to **inefficient orchestration**.
- **The Solution:** I architected **Kubernetes clusters (EKS, AKS, GKE)**, integrating **Istio service mesh** for **secure microservices communication** and **auto-scaling policies** for **dynamic resource allocation**.
- **The Impact:** IBM's **containerized workloads** now operate with **greater scalability, efficiency, and fault tolerance**, improving **operational reliability**.

Challenge: Automating Incident Response and Monitoring

- **The Problem:** IBM's cloud operations were **reactive**, leading to **delayed issue resolution and downtime risks**.
- **The Solution:** I introduced **AI-driven monitoring** by integrating **AWS CloudWatch, Prometheus, Grafana, and Splunk**, ensuring **real-time anomaly detection** and **automated incident alerts**.
- **The Impact:** Incident resolution is now **proactive and automated**, improving **service reliability** and reducing **mean time to recovery (MTTR)**.

Feb 2018 — Mar 2020

Senior Cloud Infrastructure Engineer, Accenture

Dallas, TX

Challenge: Migrating Enterprise Workloads to the Cloud

- **The Problem:** Accenture's **legacy infrastructure** was **expensive to maintain, inefficient, and lacked scalability**.
- **The Solution:** I led a **phased cloud migration strategy**, leveraging **AWS Database Migration Service (DMS), Azure Migrate, and Terraform** to **automate workload migrations** while ensuring **data integrity and zero downtime**.
- **The Impact:** Enterprise workloads now operate in a **highly available cloud environment**, enhancing **business continuity** and **operational flexibility**.

Challenge: Enhancing Cloud Security and Compliance

- **The Problem:** Accenture needed to **enforce cloud security policies** while aligning with **ISO 27001, SOC 2, and NIST standards**.
- **The Solution:** I developed **cloud security frameworks**, integrating **AWS Security Hub, Azure Sentinel, and Google Cloud Security Command Center**, with **real-time security posture assessments**.
- **The Impact:** Accenture now operates a **fully compliant cloud environment**, reducing **security vulnerabilities** and improving **audit readiness**.

Challenge: Optimizing Cloud Networking and Security

- **The Problem:** **Latency and network security vulnerabilities** impacted cloud performance.
- **The Solution:** I engineered **AWS VPC Peering, Azure Virtual WAN, and hybrid VPN tunnels**, improving **network security** and **cross-region traffic flow optimization**.
- **The Impact:** Network performance improved, reducing **data transfer latencies** and enhancing **enterprise connectivity**.

Challenge: Automating DevOps and CI/CD Pipelines

- **The Problem:** Manual deployments caused **deployment failures and inconsistent software releases**.

- **The Solution:** I implemented CI/CD pipelines using Jenkins, GitHub Actions, and ArgoCD, integrating **automated testing, blue-green deployments, and container security scanning**.
- **The Impact:** Software release cycles became **fully automated, secure, and efficient**, reducing **release failures** and improving **developer productivity**.

Challenge: Implementing High-Availability and Disaster Recovery

- **The Problem:** Critical applications lacked **disaster recovery mechanisms**, increasing **business disruption risks**.
- **The Solution:** I architected **multi-region disaster recovery strategies**, deploying **AWS Global Accelerator, Azure Traffic Manager, and GCP Load Balancers** for **automated failover and failback solutions**.
- **The Impact:** Accenture now operates with **continuous uptime**, ensuring **resilient application performance** and **business continuity**.

Mar 2015

Cloud Solutions Architect, Cognizant

Dallas, TX

Challenge: Modernizing Legacy Applications to Cloud-Native Architectures

- **The Problem:** On-premises applications required **refactoring into scalable, cloud-native solutions**.
- **The Solution:** I led the **migration to Docker and Kubernetes (EKS, AKS, GKE)**, transitioning workloads to **serverless environments** using **AWS Lambda and Azure Functions**.
- **The Impact:** Applications became **fully cloud-native**, enabling **faster deployments, increased agility, and reduced operational overhead**.

Challenge: Optimizing Hybrid Cloud Networking

- **The Problem:** **Network performance issues and security risks** limited **hybrid cloud adoption**.
- **The Solution:** I implemented **AWS Direct Connect, Azure ExpressRoute, and hybrid VPN solutions**, ensuring **secure and low-latency connections** between cloud and on-premises environments.
- **The Impact:** **Improved network performance, enhanced security, and enabled seamless hybrid cloud operations**.

Challenge: Automating Infrastructure Management

- **The Problem:** **Manual infrastructure provisioning** slowed down deployments and created **configuration inconsistencies**.
- **The Solution:** I implemented **Infrastructure as Code (IaC)** best practices using **Terraform, AWS CloudFormation, and Ansible**, ensuring **automated, repeatable deployments**.
- **The Impact:** Infrastructure provisioning became **fully automated**, reducing **deployment errors** and improving **scalability**.

Challenge: Strengthening Cloud Security Posture

- **The Problem:** **Increasing security vulnerabilities** required **proactive risk mitigation**.
- **The Solution:** I integrated **AWS GuardDuty, Azure Security Center, and Google Cloud Security Scanner**, automating **continuous security monitoring**.
- **The Impact:** **Enhanced threat detection, reduced security breaches, and ensured continuous compliance**.

EDUCATION

2022 — Jun 2023	MBA , West Coast University	Dallas, TX USA
Jan 2015 — Jun 2016	MSC Oil, Gas & Energy Engineering , University of Nicosia	Cyprus
Sep 2008 — Sep 2012	BSc. Mathematics , Michael Okpara University	Nigeria
