

ANUSHA

Sr. APIGEE Developer

apigee.anusha7@gmail.com

| +1 (418) 431-2239

LinkedIn: <https://www.linkedin.com/in/anusha-raj-65b70a2b0>

SUMMARY PROFESSIONAL:

Experienced Apigee Developer with 10 years of proficiency in designing, developing, deploying, and managing strong API solutions using Apigee X, Apigee Hybrid, and Apigee Edge platforms. Proven hands-on experience implementing end-to-end API lifecycle management, including securing APIs with OAuth 2.0, API Keys, SAML, LDAP, and mTLS, as well as leveraging traffic management, fault handling, caching, and logging policies. Strong background in CI/CD automation, with real-time integration of API deployments using Jenkins, GitHub Actions, and Docker, along with managing deployments to Kubernetes (GKE/AKS). Expertise in onboarding APIs to developer portals (Drupal-based), publishing Swagger/OpenAPI specs, and managing access for internal and external developers. Adept at collaborating with product, security, and platform teams to ensure high-performance, secure, and scalable API ecosystems for enterprise-grade cloud environments (AWS, Azure, GCP).

CORE SKILLS:

API Management:	Apigee X, Apigee Hybrid, Apigee Edge, Kong Gateway, deck, Shared Flows
Security:	OAuth 2.0, JWT, mTLS, SAML, API Keys, SSL/TLS
Cloud Platforms:	Google Cloud Platform (GCP), AWS, Azure, Anthos, GKE
DevOps / CI-CD:	Jenkins, GitHub Actions, Cloud Build, Terraform, YAML, Docker, Bitbucket
Programming / Tools:	Java, Spring Boot, JSON, XML, REST, SOAP, Postman, JMeter, SOAP UI
Monitoring / Analytics:	Stackdriver, Datadog, Sumo Logic, BigQuery, Cloud Logging
Methodologies:	Agile / Scrum, API Governance, Versioning, Documentation

WORK EXPERIENCE:

Client: Mercedes-Benz, MI
Role: Sr. APIGEE Developer
Duration: July 2019 – Present

Responsibilities:

- Automated the provisioning of Apigee X Organizations, Environments, and Environment Groups using Terraform and gcloud CLI, streamlining deployment and ensuring consistency across multiple environments.
- Designed, developed, and maintained API proxies on Apigee (Edge / X / Hybrid) across multiple environments (dev, test, prod), handling cross-cutting concerns like security, transformation, and error handling.
- Created shared flows / common policies e.g. authentication, authorization, logging, caching, spike arrest, quotas to apply consistency and reduce duplication across APIs
- Used Apigee Edge management APIs to automate proxy deployment, version control, policy updates, and integrate with CI/CD pipelines, reducing deployment time and enhancing operational efficiency.
- Automated Apigee X onboarding pipelines using Cloud Build, gcloud CLI, and Terraform, enabling self-service provisioning of proxies and environments by dev teams.
- Automated Kong configuration deployments using Kong declarative configuration (deck) and integrated them into CI/CD pipelines with GitHub Actions and Jenkins for version-controlled deployments.
- Implemented custom Kong plugins in Lua to support enterprise-specific policies not covered by out-of-the-box plugins, ensuring consistent enforcement of business logic.
- Deployed Kong in Kubernetes (K8s) alongside Apigee X, managing Kong Ingress Controller to handle service routing, authentication, and rate limiting at the cluster level.
- Worked on multi-cloud API gateway architecture combining Apigee X for external developer management and Kong for internal microservices exposure, optimizing security and scalability.
- Ensured secure communication using TLS, certificate management, keystores / truststores, and encryption of sensitive data.
- Integrated Apigee X with GCP services like Cloud Logging, Cloud Monitoring (Stackdriver), VPC SC, IAM, and Pub/Sub for auditability and observability.
- Tuned API performance via caching, rate limiting, quota, and request routing, optimizing throughput and reducing latency under load.

- Developed infrastructure-as-code (IaC) using Terraform to automate provisioning of GCP resources, including VPC networks, IAM policies, Cloud SQL, and Kubernetes clusters, ensuring consistent and repeatable deployments.
- Developed reusable Terraform modules to standardize and scale GCP infrastructure setup for new API environments across business units.
- Deployed and configured Apigee X environments to ensure seamless API management, applying standardized naming conventions and optimizing resource usage for consistency and maintainability.
- Integrated Cloud Logging, Monitoring, and Trace with Apigee X for real-time observability, enabling proactive error detection, root cause analysis, and performance tuning.
- Used Apigee Maven plugins and KVM encryption for securely storing and referencing secrets in proxy bundles.
- Integrated Apigee with identity providers / OAuth 2.0 / JWT / OpenID Connect, enabling secure token flows, SSO, and delegated authentication.
- Enforced security best practices across APIs, implementing rate limiting, API key validation, and secure authentication mechanisms to protect sensitive data and ensure compliance with industry standards.
- Integrated comprehensive monitoring, logging, and analytics solutions to track API performance, troubleshoot latency issues, and optimize API response times for improved user experience.
- Orchestrated the migration of legacy Apigee Edge Private Cloud (OPDK) APIs and configurations to Apigee X, ensuring a smooth transition with minimal downtime and service disruption.
- Performed pre-migration analysis and implemented remediation strategies for deprecated features, ensuring compatibility with Apigee X and maintaining functionality post-migration.
- Implemented GCP Deployment Manager for provisioning test environments and sandbox API gateways for internal developer testing and QA.
- Managed API backends and containerized workloads on Google Kubernetes Engine (GKE), integrating Apigee X for secure gateway access and policy enforcement.
- Built CI/CD pipelines with Cloud Build and GitHub Actions to automate the deployment of Apigee proxies, GKE containers, and Terraform templates for infrastructure updates.
- Designed and implemented API traffic routing and load balancing strategies using Apigee X, Cloud Load Balancers, and Edge Routers, significantly improving API availability and reducing response times.
- Integrated Stackdriver (Cloud Monitoring and Logging) with Apigee X and backend services to proactively monitor traffic, latency, and error rates, improving visibility and operational response.
- Configured API proxies with complex policies and ensured smooth execution of API workflows across hybrid environments, applying API layer requirements like throttling, caching, monetization, and developer portal configuration.
- Developed and integrated custom API analytics dashboards using Big Query, Stackdriver, and Datadog, enabling real-time monitoring of API health and automated alerting for proactive issue resolution.
- Utilized Cloud Application Integration (CAI) principles to design seamless workflows for integrating cloud and on-premises systems, ensuring high availability, scalability, and security.
- Automated CI/CD pipeline deployments using Jenkins, Git, Bitbucket, and Apigee X, reducing deployment cycle times and ensuring consistent delivery across environments.
- Maintained CI/CD pipelines using Git, Jenkins, and Maven to ensure automated builds and deployments across environments.
- Integrated Apigee X and backend systems with Sumo Logic for centralized log aggregation, real-time error tracking, and security auditing.
- Built custom Sumo Logic dashboards to monitor API performance, error trends, and usage analytics for business stakeholders.
- Implemented Cloud NAT and custom firewall rules for securing Apigee hybrid runtime and cloud-native applications hosted in GCP.
- Operated best practices in API security by implementing advanced features like OAuth 2.0, JWT, and API key management, ensuring secure API interactions and compliance with enterprise security standards.
- Performed extensive functional and load testing using Postman, SOAP UI, and JMeter, validating API functionality, load handling, and performance under varying traffic conditions.
- Optimized API scalability and performance through continuous monitoring, performance tuning, and benchmarking tests, ensuring high availability and efficient use of resources.
- Developed, deployed, and maintained APIs using Spring Boot with embedded Tomcat containers, Swagger for API documentation, and performed extensive testing for API reliability and accuracy.
- Managed API security audits and contributed to the development of enhanced security best practices, improving overall data protection and preventing vulnerabilities.
- Implemented Spring Security for authentication, authorization, and secure API interactions, ensuring robust security measures across all integrated systems.
- Collaborated with cross-functional teams to document API specifications, integration workflows, and technical documentation, promoting collaboration and knowledge sharing across teams.
- Migrated legacy applications to modern microservices architectures, transitioning from Spring Web Apps (WAR) to Spring Boot Web JARs and decoupling APIs for improved scalability and performance.
- Recommended hybrid and multi-cloud monitoring strategies, integrating Azure Monitor, Stackdriver, Prometheus, and Datadog to ensure comprehensive monitoring and logging across environments.
- Developed reusable API services and standardized service layers, implementing secure communication protocols and streamlining integration between internal and external systems.
- Contributed to policy and configuration management for hybrid cloud environments using AWS Outposts, Azure Arc, and GKE, ensuring consistency and reliability in multi-cloud deployments.

Client: Vanguard, PA
Role: Sr. APIGEE Developer

Duration: Nov 2017 – July 2019

Responsibilities:

- Profoundly involved in using Apigee Edge as an API Management platform to integrate and utilize APIs. I worked closely with clients to understand their specific needs and applied Apigee Edge to build API solutions tailored to their business requirements.
- I handled the full lifecycle of APIs that customers interact with. From developing APIs from scratch, deploying them to the Apigee Edge platform, troubleshooting issues using tools like Trace, and maintaining them over time to ensure performance and reliability.
- I enforced secure API access using OAuth 2.0. This included implementing token-based authentication methods that allow only authorized users or apps to access APIs via Apigee Edge.
- I prepared detailed technical documentation explaining how APIs are designed and integrated within systems. These documents acted as architectural blueprints for the development and testing teams.
- I configured multiple security layers in Apigee to protect APIs. This included managing API Keys, enabling OAuth authentication, integrating LDAP for directory-based access control, and applying content protection rules.
- I used the developer portal in Apigee to create documentation and user-friendly content for developers. This helped teams easily discover and consume available APIs.
- I set up integration with Apigee Analytics to monitor how APIs perform, analyze traffic, error rates, and latency, and use this data to fine-tune performance.
- I configured OAuth flows for both interactive (Authorization Code) and server-to-server (Client Credentials) API access and tied them into enterprise Single Sign-On systems for secure identity federation.
- I built and managed multiple environments in Apigee such as staging, testing, and production to ensure seamless deployment pipelines and testing before production releases.
- I worked on proof-of-concept projects where I built advanced proxy configurations in Apigee, tested innovative features, and prepared for full-scale API onboarding.
- I used Drupal (the CMS powering Apigee Developer Portal) to design and configure user interfaces for developers to access API documentation and tools.
- I wrote Swagger (OpenAPI) definitions in YAML or JSON formats to define API structure and operations, and then published them in the developer portal for consumption.
- I regularly backed up developer portal configurations and restored them across different environments, ensuring business continuity and disaster recovery readiness.
- I built both REST and SOAP APIs within a Service-Oriented Architecture (SOA) approach, focusing on ensuring high quality and timely delivery.
- I proactively contributed to new ideas and adapted to evolving technical and business challenges, offering practical solutions to optimize API usage and development.
- I participated in Agile ceremonies by estimating effort for assigned stories and ensured completion of development tasks within sprint timelines.
- I implemented monitoring setups that could automatically detect failures and respond—such as restarting services or alerting relevant teams consequently creating self-healing infrastructure components.
- I used Apigee's built-in Trace tool to observe live traffic through API proxies, analyze requests/responses, and quickly identify and fix errors or bottlenecks.
- I wrote backend APIs using Java frameworks and hosted them on application servers. Then, I exposed these services via Apigee Proxies for external use.
- I implemented standardized error-handling in APIs, ensuring APIs returned meaningful HTTP status codes (like 400, 401, 403, 500) to help clients understand and resolve issues faster.
- I collaborated with business stakeholders and external technical teams, guiding them on how best to use Apigee for their integration and security requirements.
- I built proxies that used traffic control policies to avoid overuse and protect backend services, leveraging Apigee's capabilities to apply quotas, rate limits, and throttling.
- I used Apigee's caching features to store API responses and reduce latency by retrieving data from cache rather than hitting backend services repeatedly.
- Working on building API proxies using APIGEE API Management with policies like Assigning messages, extracting messages, raising a fault, and Service Call Out.
- I wrote and validated Swagger (OpenAPI) specifications to ensure they conformed to expected standards, which helped in consistent API documentation and testing.
- I handled the process of onboarding external applications or developers to use APIs—issuing credentials, applying usage limits, and enabling access to APIs.
- I designed, built, and deployed API proxies using Jenkins pipelines for continuous integration and deployment, ensuring fast, automated delivery of API updates.

Client: Verizon, TX

Role: Java Developer

Duration: Feb 2017 – Nov 2017

Responsibilities:

- Collaborated directly with the client to gather enhancement requirements, provided technical analysis, and estimated effort for implementation.
- Designed and developed enhancements based on evolving client requirements, ensuring alignment with business goals.
- Developed and implemented RESTful Web Services leveraging the Spring Framework for backend service orchestration.
- Utilized Spring MVC and Hibernate for building and configuring Java Beans and integrating persistence logic.
- Implemented Hibernate persistence modules using EJB and JPA annotations, managing data operations with Entity Manager.
- Managed data access and updates efficiently using Hibernate in the DAO layer.
- Built complex, dynamic user interfaces using Struts, AJAX, and JavaScript to enhance user experience.
- Managed deployments to pre-production and production environments ensuring zero-downtime releases.
- Conducted weekly offshore status meetings, maintaining clear communication and timely delivery updates.
- Participated in UAT support activities including coding and resolving bugs raised during testing.
- Actively involved in writing and executing unit tests to ensure code quality and functionality.

Client: Google, India

Role: Java Developer

Duration: April 2014 – Sep 2015

Responsibilities:

- Participated in the design and development phases of the Agile Software Development lifecycle, contributing to sprint planning and story estimation.
- Developed application modules using the Spring Framework with a focus on the Model-View-Controller (MVC) design pattern.
- Implemented business logic components such as user authentication and account transfer workflows using Spring 4 beans in the service layer.
- Built dynamic and responsive web interfaces leveraging Spring MVC and Thymeleaf templates.
- Utilized Hibernate ORM for managing relational data persistence, including complex entity relationships.
- Created unit test cases using JUnit and automation test scripts using Selenium WebDriver integrated with Java for UI validation.
- Designed and executed business process workflows using Activiti BPM for process orchestration.
- Integrated Spring Core, AOP, Security, Batch, and Boot modules, applying annotations for dependency injection and configuration.
- Used Maven and Gradle for build automation and dependency management across the project lifecycle.
- Designed and styled web pages using HTML5, CSS, SASS, JavaScript, and the Bootstrap framework for consistent UI/UX.
- Developed and consumed both SOAP and RESTful web services using the Spring Web module.
- Built custom Spring Batch jobs for scheduled data processing tasks.
- Worked on PL/SQL programming to create database triggers, procedures, and optimized queries using Oracle.
- Configured data sources and deployed application WARs on IBM WebSphere Application Server.
- Implemented Spring Security for application-level authentication and authorization.
- Applied Slf4j and Log4j logging frameworks for tracking and debugging.
- Developed lookup tables and optimized SQL views for improved query performance.
- Utilized Jira for tracking user stories, sprint progress, and defect resolution.
- Provided support to live order management systems and participated in Quality Assurance testing and validations.

EDUCATION:

- Master's in computer science from SVU, CA, USA – Aug 2016.

- Bachelor's in computer science from Malla Reddy University, Hyderabad, INDIA – 2014.
