

PROFESSIONAL SUMMARY:

- **7+ years** of experience as a Software Engineer across healthcare, banking, e-commerce, and logistics domains, with end-to-end expertise in architecting, developing, deploying, and maintaining scalable, secure, and enterprise applications.
- Proven ability to deliver robust, high-performance solutions in **Agile, Scrum environments** by collaborating with cross-functional teams, aligning technical delivery with business objectives, reliable, and continuous deployment of feature systems.
- Played cross-functional roles across multiple enterprise projects, including **UI/UX developer**, backend **API engineer**, microservices architect, and **DevOps** collaborator ensuring end-to-end feature delivery, infrastructure reliability, and alignment with business objectives through agile execution and continuous collaboration with stakeholders.
- Designed, developed, and maintained scalable mobile test automation frameworks using **Appium with Java**, integrating modular page-object patterns, reusable test components, and CI/CD triggers. Automated functional, regression, and end-to-end test suites for both **iOS (XCUI, Swift)** and **Android (Espresso, Kotlin)** applications, and seamless integration with product release cycles.
- Automated test coverage for **native and hybrid mobile applications** across iOS and Android platforms, implementing **parallel execution strategies** on real devices and emulators. Validated critical workflows such as login, transactions, and notifications using Appium drivers, while integrating with **cloud-based device farms** for scalability. Ensured end-to-end quality.
- Implemented **Test-Driven Development (TDD)** practices by writing Java-based unit, API, and mobile UI tests before feature coding. Collaborated in **Agile Scrum ceremonies**, embedding test automation into sprint deliverables to provide faster feedback.
- Integrated **Appium** frameworks with **Jenkins pipelines**, configuring nightly builds, smoke/regression jobs, and **Allure/Extent** reporting dashboards. Enabled continuous monitoring, logging, and failure analysis for mobile test suites and releases.
- Guided and mentored **junior QA engineers** in building Appium scripts, debugging mobile automation issues, and adopting coding best practices in Java. Conducted **knowledge-sharing sessions** on frameworks, test data management, and device configurations. Partnered with **Product Owners and Scrum Masters** to align QA strategies with product roadmaps, ensuring coverage of critical user journeys and compliance with organizational quality standards.
- Collaborated with **DevOps** to integrate mobile test automation into **CI/CD pipelines** using **Jenkins** and **GitHub Actions**. Automated test triggers for pull requests and merges, ensuring early defect detection and release confidence.
- Contributed to mobile QA testing in **financial services platforms**, validating trading workflows, account dashboards, and payment gateways under heavy concurrency scenarios. Implemented **performance validation scripts** for transaction-heavy modules, ensuring compliance with **industry regulations** and high availability standards. Collaborated with business and compliance stakeholders to embed domain-specific test cases into automated frameworks for regulatory and functional coverage.
- Executed automation suites on **real devices, emulators, and simulators**, validating compatibility across OS versions, screen sizes, and network conditions. Used device cloud solutions for parallel distributed execution.
- Designed, developed, and maintained **mobile test automation frameworks** using **Appium with Java**, applying page-object design patterns, reusable components. Executed automated tests across **iOS (XCUI, Swift)** and **Android (Espresso, Kotlin)**, integrated with **AWS Device Farm, Azure App Center, and Firebase Test Lab (GCP)** for scalable, cross-platform coverage.
- Integrated Appium-based mobile automation into **CI/CD pipelines** with **Jenkins, GitHub Actions, and Azure DevOps**, enabling smoke, regression, and nightly builds. Leveraged **AWS CodePipeline, Azure Pipelines, and GCP Cloud Build** to ensure parallel execution, early defect detection, and seamless promotion of mobile test suites across development, and production.
- Implemented Test-Driven Development (TDD) and Agile QA practices by embedding automation into sprint deliverables. Partnered with developers, and Scrum Masters. Configured sprint-level reporting and test metrics dashboards using **Jira/Zephyr** integrated with **AWS CloudWatch, Azure Monitor, and GCP Operations Suite** for real-time defect tracking.
- Guided and mentored **QA engineers** on Appium scripting, debugging, and mobile test strategies. Facilitated knowledge-sharing sessions on CI/CD integration and device cloud execution. Collaborated with distributed teams across geographies to plan **QA tooling decisions**, leveraging **AWS IAM roles, Azure RBAC, and GCP IAM policies** for secure test environment access.
- Contributed to QA testing for **financial and trading mobile applications**, validating transaction-heavy workflows, account dashboards, and payment modules under high concurrency. Implemented performance validation scripts, executed on **AWS Lambda test runners, Azure Load Testing, and GCP Performance Monitoring**, ensuring compliance with **regulatory standards** and end-to-end quality across mobile releases.
- Configured **real-time logging, monitoring, and alerting** for mobile test executions by integrating **Allure/Extent Reports** with **AWS CloudWatch Logs, Azure Application Insights, and GCP Cloud Logging**. Enabled proactive defect triaging, test stability analysis, and failure diagnostics across device farms, and continuous feedback into agile release cycles.
- Defined **mobile QA strategies** spanning functional, regression, integration, and exploratory testing. Partnered with cross-functional teams to plan test coverage, identify automation candidates, and align test deliverables with sprint goals. Delivered high-quality test outcomes with feature velocity, and ensuring performance, and compliance standards across iOS and Android.
- Configured cross-cloud infrastructure using **Azure IAM, Virtual Networks (VNETs)**, and **Application Gateway** to ensure secure routing, access segregation, and TLS termination in hybrid deployments involving on-premise and Azure services.

- Built and maintained **multi-stage CI/CD pipelines** across **Jenkins**, **GitHub Actions**, and **Azure DevOps**, automating build, test, packaging, Dockerization, and deployment of full stack applications. Pipelines were configured with parallel stages.
- Managed source code using **Git** with **GitHub**, **GitLab**, and **Bitbucket**, applying **GitFlow branching**, PR reviews, tagging, and protected branches for controlled collaboration. Integrated repository hooks to trigger builds, and secure development workflows.
- Used **Maven** and **Gradle** for **Java microservice** builds, handling dependency management, test executions, and **JAR/WAR** packaging. Automated frontend workflows using **NPM scripts**, **Webpack**, and to optimize delivery of React and Angular apps.
- Enforced static code analysis and security standards through **SonarQube** integrations in all CI pipelines, monitoring metrics like, and technical debt. Incorporated **OWASP Dependency-Check** to identify and block vulnerable third-party dependencies.
- Published backend JARs to **Nexus Repository Manager**, and pushed versioned Docker images to **Docker Hub** and **GitHub Container Registry (GHCR)**. Implemented tagging conventions, and repository permissions to enable safe rollback.
- Authored **pipeline-as-code** using **Jenkinsfiles** and **GitHub YAML** workflows, integrating **Slack** and email notifications for build success/failure, test coverage drops, and deployment outcomes. Used **GitHub webhooks** to auto-trigger workflows.
- Authored custom **Bash** and **PowerShell scripts** to automate infrastructure tasks including **Docker** cleanup, **Kubernetes** pod restarts, permission fixes, and health check verifications, enhancing operational efficiency during deployments and outages.
- Developed automated API test collections in **Postman**, executed with **Newman** in CI pipelines to validate endpoint behavior. Used **Supertest** with **Chai/Mocha** for contract and integration testing in full stack projects, covering edge cases and validations.
- Extensively used **Jira** for sprint planning, task estimation, story breakdown, and bug tracking. Linked Git commits and pull requests to Jira tickets, ensuring traceability between code changes and backlog items throughout the sprint cycle.
- Created technical documentation, diagrams, and release notes in **Confluence**. Maintained test case repositories in **TestRail** and coordinated with distributed teams through **Slack**, enabling asynchronous collaboration, incident response, and velocity tracking.

Methodologies	Agile, Scrum, Sprint Planning, TDD
Languages	Java, Kotlin, Swift, SQL, JSON, YAML
Mobile Testing	Appium, TestNG, JUnit, XCUI, Espresso, Selenium, Allure, Extent Reports
Cloud	AWS (EC2, S3, RDS, EKS, CloudWatch), Azure (App Services, Blob Storage, Key Vault, Monitor), GCP (GKE, GCS, Cloud Build, Stackdriver/Operations Suite)
Domain Knowledge	Healthcare (Medicare), Banking & Financial Services (KYC/AML, Loan Origination), Retail & E-Commerce (Cart, Checkout, Discounts), Airline & Travel (Seat Booking, Dynamic Pricing)
CI/ CD	Jenkins, GitHub Actions, Azure DevOps, YAML Pipelines
Version Control	Git, GitHub, GitLab, Bitbucket, GitFlow, Pull Requests
Automation	Maven, Gradle, Webpack, NPM Scripts, Postman/Newman, ESLint, Prettier, SonarQube, OWASP
DevOps	Docker, Kubernetes (EKS, AKS, GKE), Helm, ConfigMaps, Secrets, Grafana
Databases	PostgreSQL, MySQL, MongoDB, Firebase, H2 (for tests), Spring Data JPA, Hibernate ORM, Oracle DB
Alerting& Monitoring	AWS CloudWatch, Azure Monitor, Log Analytics, Application Insights, GCP Operations Suite, KQL Dashboards, Prometheus + Grafana, Fluent Bit
Scripting	Bash, Shell (for automation scripts, log extraction, environment setup)
Ticketing	Jira, Zephyr, TestRail, Confluence

PROFESSIONAL EXPERIENCE:

Medline Industries, Chicago, IL
Customer Checkout, Lead Software Engineer

Dec 2024 – Present

Description: As a Software Engineer, I developed a scalable web-based platform focused on enhancing the Medicare beneficiary experience. The solution allows users to check Medicare eligibility, compare plans, track claims, and interact with an AI chatbot for common coverage inquiries.

- Operated within a **structured Agile Scrum environment**, engaging in **sprint planning**, user story estimation, and retrospectives. Maintained velocity and delivery quality through backlog grooming, sprint reviews, and automated reporting.

- Actively contributed to the design, development, and release of a **Medicare** coordination platform focused on improving access to post-acute services and Medline products through digital transformation. The platform covered real-time eligibility verification, care plan comparison, document handling, and request tracking simulating real-world medical workflows to end.
- Designed and maintained **Appium-based test automation frameworks in Java**, implementing page-object patterns, modular utilities, and reusable components. Automated functional, regression, and end-to-end scenarios for **Medline Medicare mobile applications** on **iOS (XCUI, Swift)** and **Android (Espresso, Kotlin)**, ensuring test coverage for eligibility verification.
- Executed automation on **real devices, emulators, and simulators**, validating compatibility across OS versions and device form factors. Ensured reliability of mobile workflows including login, claims, and benefit eligibility.
- Integrated mobile QA frameworks with **Jenkins pipelines**, enabling automated smoke, regression, and nightly test runs tied to feature branches. Configured triggers for pull requests and merges, with reporting via **Allure and Extent dashboards**. Ensured early defect detection and consistent feedback loops throughout the software development lifecycle.
- Implemented **Test-Driven Development (TDD)** practices, writing Java-based mobile UI and API tests before implementation. Participated in Agile ceremonies to align test automation with sprint deliverables, ensuring faster feedback, higher confidence.
- Guided **junior QA engineers** in Appium scripting, debugging automation issues, and following coding best practices. Conducted knowledge-sharing workshops on framework usage, test data handling, and device configurations. Collaborated closely with **Product Owners and Scrum Masters** to align QA test cases with business-critical Medicare workflows.
- Defined **end-to-end QA strategies** across functional, regression, and exploratory testing. Used **Jira/Zephyr** for defect logging, test management, and sprint reporting, ensuring visibility into coverage, defect trends, and release readiness.
- Executed mobile QA testing for **Medicare claim processing and benefit validation**, validating transactions, patient dashboards, and regulatory compliance features. Built automated validation scripts for transaction-heavy modules and payment flows, ensuring resilience under load, regulatory compliance, and reliability of mobile features across concurrent product.
- Developed and executed **regression suites** for Medicare mobile applications, ensuring stability of claims processing, eligibility validation, and discharge workflows across frequent releases. Automated **end-to-end test scenarios** in **Appium with Java**, validating data integrity across UI, API, and backend integrations. Reduced manual regression effort.
- Performed detailed **failure triage** by analyzing logs, screenshots, and execution reports. Partnered with developers to reproduce, debug, and resolve mobile defects in workflows such as enrollment, benefits, and claims management.
- Built **dynamic test data generation utilities** within the **Appium** framework to handle patient records, claims IDs, and benefit codes across iOS and Android test cases. Minimized test flakiness by introducing controlled data seeding and cleanup routines, enabling consistent, repeatable test execution across development and staging environments.
- Implemented Appium-based validations for **mobile responsiveness and performance**, measuring app launch time, page transitions, and API response times. Ensured usability for Medicare end-users, including elderly patients accessing claims.
- Configured **test execution dashboards** with Allure and Extent Reports to track pass/fail rates, defect density, and module-level coverage. Presented QA metrics in sprint reviews, enabling leadership to make data-driven release decisions. Ensured continuous visibility into test health, defect trends, and sprint-level quality improvements.
- Developed **Appium** automation scripts to validate **UI consistency, accessibility compliance, and user navigation flows** across iOS and Android devices. Ensured Medicare mobile applications met **WCAG accessibility standards** by validating font sizes, contrast, voiceover support, and input handling, improving usability for elderly patients and aligning with healthcare.
- Conducted **exploratory test sessions** in conjunction with automated coverage to identify edge cases. Applied **risk-based prioritization** for test automation, focusing on high-impact workflows such as claims submission, discharge approvals.
- Participated in **peer reviews of Appium automation code**, ensuring adherence to Java coding standards, framework design patterns, and maintainability guidelines. Enhanced framework stability by introducing version control practices, modular utilities. Improved long-term test maintainability while reducing flakiness in complex Medicare mobile workflows.
- Automated validation of **mobile-to-API interactions** by combining **Appium** UI tests with backend response checks. Ensured data consistency between mobile claim submissions, reducing defects across integrated Medicare workflows.
- Automated **end-user critical workflows** such as patient onboarding, plan comparisons, and claim status updates using **Appium with Java**. Implemented validations for field-level data entry, form submission rules, and navigation sequences across iOS and Android apps, ensuring Medicare members could reliably access benefits and track claims without functional regressions.
- Partnered with **Product Owners and compliance stakeholders** to define acceptance criteria for Medicare mobile features. Translated business rules into automated test cases, ensuring regulatory compliance and alignment with organizational quality.
- Developed and integrated multi-stage **CI/CD pipelines** using **Jenkins and GitHub Actions**, automating the complete software lifecycle for both **Java (Spring Boot)** and **Angular** projects. Pipelines included stages for code checkout, static code analysis with **SonarQube**, unit testing, build artifact generation using **Maven and Webpack**, deployment.
- Managed Git repositories hosted on **GitHub**, following structured **GitFlow branching strategies** to streamline collaborative development across backend and frontend teams. Configured **protected branches** with rules to enforce mandatory **pull requests**, successful **CI builds**, and **code reviews** before merging. Integrated **pre-merge validation hooks**, automated checks.
- Built backend services using **Maven**, automating dependency resolution, build lifecycle management, and artifact to **Nexus**.
- Integrated **SonarQube** and **OWASP Dependency-Check** into CI pipelines to enforce static code analysis, code coverage enforcement, and third-party dependency scanning, gating deployments based on quality, security, and compliance thresholds.
- Created and consumed **RESTful APIs** in **Angular** using **HttpClient**, integrating frontend modules with backend services for workflows like authentication, plan comparison, and form submissions. Validated API integrations via automated **CI jobs** that triggered Angular builds, executed unit tests, and ensured successful module-level deployments across environments.

- Stored and managed **Docker container images** in **Docker Hub** and versioned **Angular frontend build artifacts** in **AWS S3**, integrating both into automated CI/CD pipelines to maintain consistent infrastructure, enable reproducible deployments.
- Integrated **Slack notifications** and **GitHub status checks** into CI/CD workflows to provide real-time visibility into pipeline events such as build triggers, failures, approvals, and deployment success, enabling faster feedback loops and active sprints.
- Integrated backend services with **PostgreSQL**, designing normalized relational schemas and mapping them to **JPA entities** with proper relationships, indexes, and constraints. Implemented **pagination**, custom JPQL queries, and managed transactions for data integrity. Used **H2 in-memory database** for writing isolated backend integration tests, ensuring API consistency.
- Designed and optimized relational schemas in **PostgreSQL** to support high-volume transactional modules such as user registration, order processing, claim tracking, and audit logs. Applied normalization techniques, enforced foreign key constraints, and tuned SQL queries using indexed columns, CTEs, and joins to improve query performance in large datasets.
- Used **Spring Data JPA** with **Hibernate ORM** for seamless database integration, implementing entity mappings, repository interfaces, and **JPQL/Criteria-based** custom queries. Leveraged eager fetching strategies, cascade types, and performance.
- Wrote **Bash scripts** to automate critical DevOps workflows including Docker container cleanup, Kubernetes pod health checks, build artifact cleanup, log archiving, and deployment validations. These scripts improved response time during incidents.
- Managed end-to-end sprint workflows using **Jira**, including epic/story creation, sub-task breakdown, sprint backlog refinement, and real-time status tracking. Collaborated with **QA, PMs**, and design teams to ensure timely delivery to user.
- Authored and maintained project documentation in **Confluence**, including API specifications, database diagrams, frontend setup guides, and DevOps runbooks to support onboarding, support teams, and knowledge sharing across cross-functional units.

Environment: Appium, Java, TestNG, JUnit, XCUI, Espresso, Swift, Kotlin, Jenkins, GitHub Actions, Allure, Extent Reports, Jira, Zephyr, Agile Scrum, TDD, Regression & End-to-End Testing.

Citi Bank, Chicago, IL

June 2024 – Dec 2024

Digital KYC Enablement Team, Sr Software Engineer

Description: As a Software Engineer at Citi Bank, I played a key role in the development of an Automated Loan Origination & Risk Assessment Platform, built to streamline the end-to-end loan lifecycle for both retail and SME customers. This platform aimed to accelerate the digital loan application process by reducing manual intervention, enabling real-time decisioning, and ensuring regulatory compliance (KYC, AML).

- Collaborated closely with developers, QA engineers, and site reliability teams in an **Agile Scrum environment**, participating in sprint planning, daily stand-ups, and retrospectives to ensure fast feedback cycles and cross-functional alignment.
- Collaborated with **business analysts, UI/UX teams, DevOps engineers, QA testers**, and **product owners** to translate epics into implementable features, ensuring end-to-end technical, functional coverage, staging, and production environments.
- Designed and maintained **Appium-based automation frameworks in Java**, implementing page-object design, modular utilities, and reusable components. Automated functional, regression, and end-to-end test cases for **Citi Bank's loan origination and risk assessment mobile applications** on **iOS (XCUI, Swift)** and **Android (Espresso, Kotlin)**, ensuring coverage for onboarding, KYC verification, and loan eligibility workflows.
- Executed automation suites on **real devices, emulators, and simulators**, validating compatibility across OS versions and devices. Ensured consistent performance of mobile banking workflows such as login, loan application, and credit scoring.
- Implemented **TDD practices** by writing Java-based mobile UI and API tests before feature coding. Collaborated in Agile Scrum ceremonies to embed automation into sprint deliverables, ensuring faster release readiness for loan and compliance.
- Mentored **junior QA engineers** on Appium scripting, debugging mobile automation failures, and following coding standards. Led workshops on framework design, reusable utilities, and best practices for mobile QA. Partnered with **Product Owners and Scrum Masters** to align test cases with business requirements for regulatory compliance, and customer onboarding.
- Used **Jira and Zephyr** for defect logging, test planning, and sprint reporting. Tracked regression trends and integrated reports into sprint reviews to support release decisions for mobile banking applications.
- Integrated mobile automation into **Jenkins and GitHub Actions pipelines**, configuring smoke, regression, and nightly test jobs. Implemented pull request-based triggers with automated Allure and Extent reporting dashboards. Enabled early defect detection and continuous quality feedback during sprint releases for mobile modules handling loan origination, credit scoring.
- Developed and executed automated test cases for **financial workflows**, including account creation, loan approvals, credit checks, and payment transactions. Automated validations for **regulatory compliance checks (AML/KYC)** and risk assessment modules, ensuring reliable decisioning. Contributed to maintaining functional coverage for high-transaction mobile workflows.
- Developed and maintained **regression automation suites** using Appium with Java, covering key banking workflows such as customer onboarding, loan eligibility, EMI calculators, and payment gateways. Automated **end-to-end scenarios** validating data flow from mobile UI to backend systems, ensuring functional integrity across frequent sprint releases.
- Performed detailed **failure triage** by analyzing **Appium** logs, screenshots, and execution reports. Collaborated with developers to reproduce and resolve defects in modules like credit risk scoring, loan disbursement, and KYC verification.

- Created **dynamic test data generation utilities** in **Appium** frameworks to simulate credit scores, loan IDs, and customer profiles. Implemented controlled test data setup and cleanup routines, ensuring stability in automated workflows across iOS and Android. Minimized test flakiness and improved reproducibility of loan origination and real-time compliance validation.
- Automated validations for **app responsiveness and performance**, tracking login speed, loan application submission time, and credit calculation accuracy. Ensured **usability** for banking customers accessing sensitive workflows under varying device.
- Developed **Appium** test cases to validate **UI consistency, navigation flow, and accessibility compliance** across iOS and Android banking applications. Ensured adherence to **WCAG accessibility guidelines** by validating text scaling, contrast ratios, and voiceover support, enabling inclusive access to Citi Bank's mobile loan origination and risk assessment services.
- Conducted **exploratory test sessions** alongside automation to capture edge cases. Applied **risk-based prioritization**, automating high-impact workflows such as fraud detection alerts, loan approval notifications, and multi-step credit verification.
- Designed and implemented **multi-stage pipelines** using **GitHub Actions** and **Jenkins**, **orchestrating** build, test, and deploy workflows triggered by PRs, commits, and tagged releases. Defined stages including, static analysis (**SonarQube**), packaging (**Maven**), **Dockerization**, and deployment to AWS, supporting blue-green and canary strategies for zero-downtime releases.
- Integrated security gates such as **OWASP Dependency-Check** and quality gates from **SonarQube**, blocking deployments when vulnerabilities or coverage drops were detected. Configured real-time **Slack notifications**, GitHub PR checks, and email alerts for build status, test failures, and environment deploys, enabling fast rollback decisions and continuous monitoring.
- Used **Git with GitHub**, following the **GitFlow branching model** for managing feature, hotfix, and release branches; maintained codebase integrity using protected branches, required approvals, and commit conventions. Automated merge validation using GitHub status checks, ensuring that only builds passing CI, **SonarQube** scan, and peer review.
- Used **Apache Maven** for compiling, testing, and packaging Spring Boot microservices with multi-module support, profile-based configuration (dev, qa, prod), and artifact versioning. Leveraged Maven plugins such as maven-surefire, jacoco, and versions to run tests, generate coverage reports, and automate semantic version bumps during pipeline builds.
- Created **custom NPM scripts** for building Angular apps with environment-specific variables, AOT compilation, and cache-busting using Webpack. Automated cleaning, asset hashing, and deployment of optimized bundles to **AWS S3**, with validations.
- Used **H2 in-memory database** to simulate PostgreSQL in unit and integration tests for Spring Boot services, CI pipelines.
- Integrated **MongoDB** for handling unstructured and semi-structured data such as loan document metadata, chatbot logs, and KYC file uploads. Used **Spring Data MongoDB** to define document models, perform aggregation queries, and flexible schema.
- Wrote custom **Bash scripts** for Docker cleanup, log rotation, Kubernetes pod management, and pre/post-deployment validations. Embedded scripts in **Jenkins pipelines** and GitHub Actions workflows to reduce manual ops, and deployment.
- Defined reusable **NPM scripts** to automate build, lint, and deploy tasks for React apps; leveraged Webpack and environment toggling for production optimization. Deployed static bundles to **AWS S3** using CLI and scripts to ensure cache-busting.
- Used **Jira** for backlog grooming, sprint planning, and active sprint execution; tracked feature development, bugs, and technical debt using detailed user stories and subtasks. Linked commits and PRs with **Jira tickets** via smart commits for traceability.
- Participated in sprint ceremonies, contributed to effort estimation, and reviewed sprint metrics through Jira dashboards. Monitored team velocity, flagged blockers early, and collaborated with QA for bug resolution, test case tracking, and release readiness.

Environment: Appium, Java, TestNG, JUnit, XCUI, Espresso, Swift, Kotlin, Jenkins, GitHub Actions, Allure, Extent Reports, Jira, Zephyr, Agile Scrum, TDD, Regression & End-to-End Testing, Accessibility & Usability QA.

Zara, India
Software Engineer

Aug 2019 – Dec 2023

Description: Worked on a Product Recommendation System that enhances user shopping experience by providing personalized product suggestions, price tracking, and review sentiment analysis. As a full-stack developer, I designed and implemented core modules including recommendation logic, price monitoring engine, and review analytics dashboard, simulating real-world e-commerce functionality.

- Followed **Agile methodology** to support continuous integration and delivery in a fast-paced fashion retail platform. Collaborated closely with cross-functional teams to manage sprint cycles, task breakdowns, and feature releases using **Jira**.
- Designed and implemented **Appium**-based test automation frameworks in Java for Zara's e-commerce **mobile** applications. Applied page-object design patterns and reusable components to automate functional, and end-to-end test cases across **iOS (XCUI, Swift)** and **Android (Espresso, Kotlin)** platforms. Ensured quality coverage for workflows like product search.
- Executed test automation suites on **real devices, emulators, and simulators**, validating compatibility across OS versions, screen sizes, and device form factors. Verified consistency of shopping journeys across Zara's Android and iOS apps.
- Integrated **Appium** automation frameworks into **Jenkins** and **GitHub Actions** pipelines, configuring smoke, regression, and nightly jobs for retail mobile applications. Set up triggers on pull requests and merges, with **Allure** and Extent dashboards for reporting. Delivered consistent feedback loops ensuring stable mobile releases aligned with Zara's rapid e-commerce product.
- Implemented TDD practices by developing Java-based UI and API test cases before feature implementation. Participated in Agile ceremonies, embedding automation into sprint deliverables for modules like wishlist, personalized recommendations.

- Mentored junior QA engineers in **Appium** script development, framework debugging, and coding best practices. Conducted training sessions on test case design, modular utilities, and mobile data handling. Partnered with Product Owners and Scrum Masters to align automated test cases with Zara's business-critical e-commerce workflows including promotions, discounts.
- Created and executed **regression automation suites** covering shopping cart, wishlist, and payment workflows. Automated **end-to-end scenarios** validating product discovery, price adjustments, and checkout, ensuring defect-free customer journeys.
- Performed failure analysis by reviewing logs, screenshots, and **Appium** execution reports. Partnered with developers to identify root causes and resolve mobile automation issues in areas such as product recommendation modules, cart synchronization, and discount calculations. Reduced recurring defects by adding targeted regression tests to the automation suite.
- Built **dynamic test data utilities** for user accounts, product catalogs, and discount codes. Ensured stability of automated scenarios by introducing reusable test data handling and cleanup processes across iOS and Android workflows.
- Automated validations for **UI consistency and accessibility compliance** across Zara's **iOS and Android** apps, following **WCAG standards**. Verified contrast ratios, font scaling, and voiceover support to ensure usability for global customer groups. Enhanced **shopping accessibility** for visually impaired users while maintaining consistency in product browsing.
- Conducted **exploratory testing** alongside automation to identify edge cases in cart synchronization and promotional pricing. Applied **risk-based prioritization** by automating high-impact workflows like payment gateways and loyalty point.
- **Worked in Agile Scrum environment**, participating in sprint planning, daily stand-ups, backlog grooming, and retrospectives; used **Jira** for ticket management, estimation, bug tracking, and coordinating cross-functional feature releases.

Environment: Appium, Java, TestNG, JUnit, XCUI, Espresso, Swift, Kotlin, Jenkins, GitHub Actions, Allure, Extent Reports, Jira, Zephyr, Agile Scrum, TDD, Regression & End-to-End Testing, Accessibility & Usability QA.

TruJet, India
Software Engineer

May 2017 – Aug 2019

Description: Built a full-stack airline seat management and dynamic pricing system to optimize seat allocation, pricing, and booking flow based on real-time demand, seat class, and flight timing. The system automates fare adjustments, manages booking rules, and provides an internal admin interface to monitor seat availability and revenue trends. It also integrates real-time notifications and security with role-based access control.

- Collaborated as a Software Engineer within an **Agile cross-functional** team, contributing to continuous integration, infrastructure automation, and system reliability across all phases of the **SDLC** for an airline booking and pricing platform.
- Developed and maintained **Appium-based automation frameworks** in **Java** for TruJet's airline booking mobile applications. Applied page-object design and reusable components to automate **functional, regression, and end-to-end test cases** across **iOS (XCUI, Swift)** and **Android (Espresso, Kotlin)** platforms. Ensured automation coverage for seat booking. Executed test automation on **real devices, emulators, and simulators**, validating compatibility across OS versions and device models. Verified reliability of flight search, booking, and payment modules on both Android and iOS platforms.
- Integrated Appium automation into **Jenkins pipelines**, enabling automated smoke, regression, and nightly builds for airline mobile applications. Configured test triggers on pull requests and merges, with detailed execution reports using **Allure and Extent dashboards**. Delivered **continuous quality feedback** across sprint releases for critical workflows.
- Adopted **TDD practices** by creating mobile UI and API tests before feature development. Collaborated in Agile Scrum ceremonies to align test coverage with sprint deliverables, ensuring faster feedback for booking and payment features.
- Mentored **junior QA engineers** in writing Appium scripts, debugging automation failures, and designing reusable test utilities. Conducted knowledge-sharing sessions on mobile testing best practices, defect triage, and reporting. Partnered with **Product Owners and Scrum Masters** to align automated test cases with airline workflows such as real-time seat allocation.
- Designed and executed **regression automation suites** validating flight search, booking, and payment journeys. Automated **end-to-end test scenarios** covering booking-to-boarding workflows to ensure reliability across frequent airline releases.
- Performed **failure triage** by analyzing **Appium** logs, execution screenshots, and test reports. Partnered with developers to debug and resolve defects in modules such as passenger details, baggage selection, and payment gateways.
- Automated validations for **UI consistency and accessibility compliance** across TruJet's mobile booking applications. Verified voiceover support, font scaling, and input handling to meet **WCAG accessibility standards**. Ensured elderly passengers could seamlessly search flights, manage bookings, and access boarding passes with inclusive design and reliable mobile functionality.
- Automated validations for **UI consistency and accessibility compliance** across TruJet's mobile booking applications. Verified voiceover support, font scaling, and input handling to meet **WCAG accessibility standards**. Ensured elderly passengers could seamlessly search flights, manage bookings, and access boarding passes with inclusive design and reliable mobile functionality.
- **Followed Agile Scrum practices**, actively participating in sprint planning, daily standups, retrospectives, and backlog grooming; tracked work using **Jira**, documented release notes in **Confluence**, and collaborated across distributed dev and QA.

Environment: Appium, Java, TestNG, JUnit, XCUI, Espresso, Swift, Kotlin, Jenkins, Allure, Extent Reports, Jira, Zephyr, Agile Scrum, TDD, Regression & End-to-End Testing, Accessibility & Usability QA.
