SUMMARY

Senior Data Engineer with extensive experience designing and scaling petabyte-scale data infrastructure at Meta. Expertise in building reliable batch and streaming pipelines, optimizing Spark workflows, and enabling cross-cloud integrations. Skilled in data quality automation, observability, and compliance for mission-critical Ads datasets. Proven collaborator with ML and product teams, and mentor for engineers on best practices in large-scale data systems.

SKILLS

Presto	Hive	Spark	Flink	Kafka	Airflow	AWS S3	Google BigQuery	Python	SQL	Java
GitHub Actions	CI/CD	Docker	Kubernetes	schema validation	lineage tracking	GDPR/CCPA compliance				
partitioning	bucketing	predicate pushdown	monitoring dashboards	anomaly detection						

EXPERIENCE

05/2018 - Present

● Meta

Senior Data Engineer

- Extended and optimized petabyte-scale Ads data pipelines built on Presto, Hive, Spark, and Airflow, improving reporting SLAs and reliability across billions of daily events.
- Enhanced real-time streaming workflows with Kafka + Flink, cutting latency for ad impression and clickstream metrics by 40%.
- Developed hybrid export pipelines to AWS S3 and Google BigQuery, enabling secure advertiser reporting and partner analytics outside Meta's internal systems.
- Tuned Spark jobs with partitioning, bucketing, and predicate pushdown, lowering compute costs by 20% while improving query efficiency at scale.
- Introduced data quality checks and anomaly detection pipelines (using Great Expectations and internal frameworks), reducing production incidents by 30%.
- Built observability dashboards and alerting pipelines to track data freshness, schema drift, and pipeline health for mission-critical Ads datasets.
- Partnered with ML engineers to extend feature pipelines into Meta's internal feature store, supporting personalization and ads ranking models in production.
- Contributed to compliance initiatives (GDPR, CCPA), implementing lineage tracking, schema validation, and fine-grained access controls for sensitive Ads data.
- Automated CI/CD workflows for data pipelines with internal tooling and GitHub Actions, introducing schema contract testing and version-controlled deployments.
- Mentored junior engineers on pipeline design, Spark optimizations, and cross-cloud integration practices, strengthening team delivery and engineering standards.

05/2018 - 08/2018

● Meta

Software Engineer Intern

- Built a generic and central infrastructure using Python for offline prevalence sampling, improved 5 teams' efficiency on building prevalence metric under different environments.
- Implemented dynamic chunking to achieve higher space efficiency on chronos machines.
- Developed and led the prevalence migration pipeline for several teams, e.g. feed integrity and celebrity impersonation, with 0 committed issues.
- Designed the SRT jobs invalidation automation program in PHP on pipeline failures.
- Enhanced the monitoring system by adding verbose info and supporting multiple scenarios to ensure the reliability of the platform.

EDUCATION

2014 - 2018

● Bachelor's in Computer Science

Carnegie Mellon University
