

Lakshmi Priyanka P
Senior Java Full Stack Developer
945-222-8737

plakshmipriyanka04@gmail.com

<https://www.linkedin.com/in/lakshmi-priyanka-p-5960b3144/>

Professional Essence

- **Senior Java Full Stack Developer** with **11+ years** of experience building scalable, enterprise-grade web applications. Skilled in Java, cloud platforms, microservices and modern front-end technologies. Strong advocate of Agile development, CI/CD and code quality best practices. Proven ability to deliver high-performance solutions in collaborative team environments.
- **Development Methodologies:** Comprehensive exposure to the full SDLC, with a track record of delivering results within Agile environments utilizing Scrum and Kanban methodologies.
- **Programming Languages:** Deep technical fluency in Java (versions 21, 19, 17, 14, 11 and 6), enabling the development of robust and scalable enterprise solutions.
- **Backend Frameworks:** Extensive mastery of the Spring ecosystem including Spring Boot, MVC, Security, Batch, JPA (Hibernate) and JDBC and Node.js for high-performance backend development.
- **API Development:** Demonstrated expertise in building and integrating RESTful APIs with JSON, GraphQL, gRPC and SOAP APIs using XML for diverse service communication needs.
- **Frontend Technologies:** Advanced command of modern frontend technologies, including HTML5, CSS3, Bootstrap, JavaScript, TypeScript and Ajax, driving user-centric UI development.
- **Frontend Frameworks:** Versatility in leveraging Angular, React and JQuery frameworks to architect and deliver engaging, interactive web applications.
- **Frontend Testing:** Proficient in comprehensive Angular testing (Cypress, Karma, Jasmine) and React testing (Jest, React Testing Library, Enzyme), ensuring code reliability and quality.
- **JQuery Expertise:** Proficient in leveraging jQuery for advanced DOM manipulation, event handling, AJAX communication and seamless plugin integration, enabling dynamic and responsive client-side interactions.
- **State Management:** Experienced in modern state management libraries including Redux, NgRx and Context API, with the ability to architect scalable, maintainable and predictable UI data flows across complex applications.
- **Frontend Build Tools:** Skilled in using Webpack and Babel for front-end build optimization, enabling faster load times, modular code bundling and streamlined deployment workflows.
- **Software Architecture:** Rich architectural insight into Monolithic, Microservices, SOA and Event-Driven approaches, with a focus on solution scalability and flexibility.
- **API Gateway Solutions:** Applied expertise in API Gateway solutions, including Netflix Zuul, Spring Cloud Gateway and Nginx, for centralized request routing and load balancing.
- **ORM & Persistence:** Solid grounding in ORM and persistence strategies using Hibernate and MyBatis for efficient database communication.
- **Databases:** Broad exposure to relational and NoSQL databases Azure Cosmos DB, PostgreSQL, MySQL, MongoDB and Oracle tailoring storage solutions to business needs.
- **Cloud & Containerization:** Hands-on experience with AWS and Azure and managing containerized applications using Docker and Kubernetes for scalable and reliable deployments.
- **CI/CD Automation:** Skilled in orchestrating CI/CD pipelines with GitLab CI/CD (runner), Bitbucket Actions, Jenkins and Bamboo, streamlining automated deployments.
- **Build Tools:** Proficiency with diverse build tools, including Bazel, Gradle, Apache Maven and Apache Ant, supporting robust and maintainable codebases.
- **Code Quality & IDEs:** Strong focus on code quality, leveraging SonarQube, Checkstyle and PMD, alongside fluency with IDEs such as Visual Studio Code, Android Studio, IntelliJ IDEA, Eclipse and NetBeans.
- **Messaging & Application Servers:** Capable of integrating messaging (Apache Pulsar, Kafka, RabbitMQ, ActiveMQ) and deploying applications to WildFly, Payara Server, GlassFish, Apache Tomcat and IBM WebSphere.
- **Version Control Systems:** Proficient in distributed version control tools including Azure DevOps, GitLab, GitHub, Mercurial, Bitbucket and Apache Subversion for efficient codebase management and team collaboration.
- **Bug Tracking Tools:** Adept at using issue tracking and project management platforms such as Redmine, Trac, JIRA, Mantis BT and FogBugz to streamline defect tracking and cross-functional team coordination.
- **Testing, Logging & Documentation:** Brings a strong testing and documentation culture, applying JUnit, TestNG, Mockito, Selenium, Postman, Cucumber for test automation, comprehensive logging (Log4j, SLF4J, Logback) and rich documentation practices via Confluence, GitLab Wiki, Bitbucket Wiki and SharePoint.

Senior Java Full Stack Developer

Project Responsibilities:

- Led end-to-end **SDLC** for enterprise financial applications, ensuring regulatory compliance, efficient sprint delivery, and continuous integration across mission-critical banking systems and Championed **Agile** practices by facilitating Scrum ceremonies and retrospectives to enhance team collaboration and release velocity.
- Developed scalable fintech applications using **Java 19**, later upgraded to **Java 21**, leveraging advanced language features (**Virtual Threads, Structured Concurrency, Sealed Classes, FFM API**) to improve throughput and latency in high-volume transaction processing systems.
- Designed and implemented backend services using **Spring Boot** within a **microservices architecture**, ensuring modularity, reusability and high availability for distributed payment gateways, fraud detection and trading systems.
- Integrated **Spring Security** with **Keycloak (OAuth2/OIDC)** to centralize IAM, enforce fine-grained access control, and enable SSO across multiple financial microservices, improving regulatory compliance and data protection under PCI DSS and SOC2 standards.
- Built RESTful APIs using **Spring MVC**, designing controller layers for banking APIs, loan management, and transaction reporting, ensuring robust communication between frontend trading dashboards and backend financial data engines.
- Implemented **Spring Cloud Gateway** to manage routing and filtering of microservices across financial domains, integrating **service discovery** and circuit **breaker** patterns to ensure resilience in real-time trading and transaction networks.
- Orchestrated high-volume batch data workflows using **Spring Batch**, optimizing end-of-day settlement, reconciliation, and reporting pipelines for financial transactions to ensure accuracy, auditability, and compliance.
- Utilized **Spring JPA** with **Hibernate** to manage persistence layers, leveraging **EntityManagerFactory**, **CriteriaAPI**, and **Native Queries** for dynamic data retrieval across **MongoDB** and **SQL** databases storing ledger, transaction, and risk assessment data.
- Developed and tested REST APIs integrated with **Amazon API Gateway** with **JSON tokens**, and employed **Rest Assured** for comprehensive testing of banking service endpoints, ensuring data integrity and API reliability.
- Implemented interactive front-end components using **TypeScript**, **HTML**, **CSS**, and **Bootstrap** to build trading dashboards, customer portals, and financial visualization tools optimized for performance and accessibility.
- Designed and developed scalable single-page applications using **Angular 14**, later upgraded to **Angular 16**, leveraging Standalone APIs, Signals, and enhanced SSR performance to deliver real-time dashboards and analytics interfaces for financial transactions, portfolio management, and reporting systems, improving user experience and maintainability.
- Managed complex application states with **NgRx** for **Angular** dashboards displaying portfolio, credit, and transaction analytics, and implemented UI testing frameworks (**Karma**, **Jasmine**) to maintain frontend reliability.
- Utilized **Node.js** on the backend for auxiliary services supporting asynchronous event-driven financial data processing, ensuring low-latency intercommunication between KYC modules and customer data services.
- Deployed serverless and containerized financial applications on **AWS Cloud** using **Lambda**, **RDS**, **ECS**, **Fargate**, **CloudWatch** and **Step Functions** for scaling critical services such as payment orchestration and fraud monitoring.
- Containerized applications using **Docker** and orchestrated deployments with **Kubernetes**, integrating with **Amazon EKS** for managing containerized financial workloads at enterprise scale.
- Integrated **Large Language Models (LLMs)** with backend services through **MCP Server**, implementing Retrieval-Augmented Generation (**RAG**) pipelines to automate financial reporting, chatbot-driven customer support, and intelligent query resolution for compliance teams.
- Established and maintained CI/CD pipelines using **Jenkins**, integrating with **AWS CodePipeline** and enforcing code quality gates with **SonarQube** to ensure reliable delivery of secure and compliant financial software.
- Employed **AI-driven** tools such as **GitHub Copilot** to automate DevOps tasks including building **CI/CD pipelines**, writing **YAML configurations**, and generating **infrastructure-as-code templates (Terraform, CloudFormation)**, while analyzing system logs to identify and suggest proactive fixes for deployment and monitoring issues.
- Managed builds and dependencies using **Maven** and **Webpack**, optimizing packaging and deployment processes, while utilizing **IntelliJ IDEA** for development and **Prometheus** for real-time system monitoring of financial microservices.
- Implemented distributed messaging with **Apache Kafka** for real-time transaction streaming and fraud detection, deploying **Java microservices** on **Apache Tomcat** to support event-driven banking workflows.

- Integrated **MongoDB** with **Amazon S3** for secure, scalable financial data storage and archival, ensuring redundancy and encryption; managed code and issues via **GitLab** and **Jira**.
- Developed unit tests with **JUnit**, configured logging with **Log4j** and **Log Rocket** for observability, and authored documentation in **GitLab Wiki** to support audit and compliance standards.
- Leveraged **GitHub Copilot** to **generate and refactor backend code** in **Java** and **Spring**, accelerating development of financial microservices, improving code consistency, and enhancing productivity through AI-assisted code suggestions and test generation.

Concentra, Dallas, TX

May 2021- July 2023

Senior Java Full Stack Developer

Project Responsibilities:

- Spearheaded end-to-end SDLC execution within **Agile** frameworks (**Scrum, Kanban**), optimizing workflows and cross-functional collaboration among clinicians, analysts, and engineers to accelerate delivery of healthcare software and improve on-time releases.
- Designed and deployed high-performance backend services in **Java 14**, leveraging modern language features to process sensitive patient data efficiently, streamline maintainability, and reduce production defects by 15%.
- Built and deployed scalable **microservices** using **Spring Boot**, enabling secure integration of EHR systems, patient management modules, and healthcare data exchange APIs.
- Designed robust data access layers with **Spring JPA**, managing complex entity relationships for patient records, lab data, and medical billing systems using custom repositories and criteria-based filtering.
- Reinforced enterprise-grade healthcare security using **Spring Security** and **Spring Batch**, implementing **OAuth2**-driven access control and HIPAA-compliant data processing to ensure patient data privacy and regulatory adherence.
- Engineered high-performance, event-driven backend systems with **Node.js**, leveraging non-blocking I/O and modular architecture to enable real-time updates for medical dashboards and appointment tracking systems.
- Delivered responsive, mobile-first healthcare portals using **HTML5, CSS3, Bootstrap**, and **TypeScript**, improving accessibility and user experience for both patients and clinicians.
- Built single-page healthcare applications with **Angular 9**, utilizing the **Ivy Engine, Strict Templates**, and **NgRx** for state management, ensuring efficient rendering and seamless user experience across patient engagement tools.
- Designed and implemented modular systems based on **Microservices Architecture**, enabling independent deployment of EMR components, improving fault isolation, and ensuring system resilience under regulatory audits.
- Developed secure **RESTful APIs** with **Spring Cloud Gateway**, using **JSON Web Tokens (JWT)** for authentication and centralized routing of sensitive medical data between internal systems and third-party integrations.
- Architected and deployed **cloud-native healthcare solutions** on **Azure**, leveraging **Virtual Machines, Azure Functions** for serverless medical data processing, and **Azure Kubernetes Service (AKS)** for orchestrating containerized healthcare microservices.
- Containerized critical application components using **Docker** and orchestrated workloads via **Kubernetes**, ensuring zero downtime for patient-facing systems and improving deployment reliability for clinical environments.
- Designed and implemented automated **CI/CD** pipelines with **GitHub Actions**, integrating unit testing, static analysis, and multi-environment deployments to ensure consistent and compliant healthcare software releases.
- Utilized **Hibernate** for object-relational mapping of patient and clinical data, optimizing performance through lazy/eager loading, native queries, and second-level caching for high-availability healthcare databases.
- Designed and optimized **NoSQL** data models using **Azure Cosmos DB** and **Cassandra**, enabling low-latency access to distributed healthcare data such as medical histories and imaging metadata.
- Configured build pipelines with **Bazel** and enforced code quality through **SonarQube**, enhancing maintainability and ensuring code compliance with healthcare software engineering standards.
- Developed cross-platform mobile components using **Android Studio** and implemented asynchronous communication with **RabbitMQ**, enabling secure real-time exchange of lab results, patient alerts, and care coordination updates.
- Deployed enterprise-grade healthcare applications on **Payara Server** and managed version control and automated releases through **GitHub**, ensuring traceable and reliable deployments across clinical systems.
- Tracked software issues via **Redmine**, ensured quality assurance using **JUnit** and **Karma**, implemented structured application logging with **SLF4J**, and maintained architecture and compliance documentation in **GitHub Wiki** to support internal audits and HIPAA readiness.

GEICO, Chevy Chase, MD

Jan 2019- March 2021

Java Full Stack Developer

Project Responsibilities:

- Directed full-cycle software delivery using **SDLC** and **Agile (Scrum)** methodologies, applying structured design and analysis to deliver reliable, high-quality, and timely insurance software solutions for underwriting and claims automation.
- Engineered high-performance backend services in **Java 7**, utilizing advanced design patterns and language features to improve the efficiency and reliability of core insurance data processing systems.
- Built production-ready **microservices** using **Spring Boot**, leveraging auto-configuration, embedded servers, and starter modules to streamline backend development for policy, claims, and customer service operations.
- Implemented **MVC architecture** with **Spring MVC**, designing modular controller logic and RESTful routing to enable scalable, maintainable web application layers for policy management and agent portals.
- Managed robust persistence layers with **Spring JPA** and **Hibernate**, mapping complex entity relationships between policyholders, claims, and premium structures, and improving query performance through optimized fetching strategies.
- Developed responsive, accessible front-end applications using **HTML5**, **CSS3**, **Bootstrap**, and **JavaScript**, ensuring cross-browser compatibility and compliance with accessibility standards for customer and agent interfaces.
- Built dynamic, component-driven interfaces using **React 16**, implementing hooks and reusable components to deliver intuitive dashboards for underwriters, claim adjusters, and customer service representatives.
- Designed scalable service ecosystems following **Service-Oriented Architecture (SOA)** principles on **AWS**, ensuring interoperability among policy systems, claims engines, and external regulatory data sources.
- Developed distributed backend services and APIs aligned with **Microservices** principles, exposing secure **REST APIs** using **JSON** over **HTTP** on **AWS** to enable lightweight client communication for quote and claims processing.
- Centralized API management using **Kong API Gateway** deployed on **AWS**, implementing authentication, rate limiting, and traffic monitoring to secure and streamline communication between insurance microservices.
- Designed and optimized flexible schema data models in **MongoDB** hosted on **Amazon DocumentDB**, enabling efficient handling of diverse insurance data including claims histories, customer records, and premium calculations.
- Architected and automated secure, scalable cloud infrastructure on **AWS (Terraform, EC2, S3, VPC, IAM)** using **Infrastructure as Code (IaC)**, ensuring reliable deployment and compliance with data protection standards.
- Containerized insurance applications with **Docker** and orchestrated deployments using **Kubernetes**, ensuring fault-tolerant services for high-volume policy and claim transaction workloads.
- Implemented automated **CI/CD pipelines** with **GitLab CI/CD**, integrating build, testing, and deployment directly into version control to accelerate delivery and improve software reliability across insurance modules.
- Managed scalable builds using **Gradle**, optimizing project structures and parallel execution to accelerate the development of premium calculation and policy renewal services.
- Maintained high code quality through static analysis with **PMD**, proactively identifying defects and enforcing engineering standards; used **IntelliJ IDEA** for intelligent code refactoring and debugging of core systems.
- Enabled real-time, event-driven architecture using **Kafka**, supporting asynchronous communication between underwriting, claims, and fraud detection modules, improving operational efficiency and data flow reliability.
- Deployed insurance applications on **Apache Tomcat**, maintained source control and automated version management with **GitLab**, and tracked bugs and issues using **FogBugz** for transparent project oversight.
- Implemented unit testing using **Mockito**, configured structured logging with **Logback** for audit and observability, and documented workflows, architecture, and compliance standards in **GitLab Wiki** to ensure traceability and internal governance adherence.

Target, Brooklyn Park, MN

July 2016- Dec 2018

Java Developer

Project Responsibilities:

- Led end-to-end **SDLC** activities within **Agile** teams, conducting sprint planning and backlog grooming to ensure timely delivery of e-commerce features, personalized shopping experiences, and inventory management modules.
- Developed and maintained high-performance backend solutions in **Java 6**, utilizing **Scripting APIs**, **Pluggable Annotation Processing API**, and **JAXB 2.0** for efficient product data binding, catalog transformation, and system interoperability.
- Designed and implemented scalable **microservices** and **RESTful APIs** using **Spring Boot**, enabling modular and reusable components for order processing, cart management, and customer account systems.
- Built secure and optimized data access layers leveraging **Spring JDBC**, implementing transaction management and SQL optimization for retail data operations including pricing, discounts, and order fulfillment.

- Developed modern, responsive frontends using **HTML5**, **CSS3**, **Bootstrap**, and **JavaScript**, ensuring seamless cross-browser shopping experiences and mobile-first UI for customers.
- Architected and implemented dynamic single-page applications with **AngularJS**, applying event-driven architecture principles to deliver real-time updates for inventory visibility and customer order tracking.
- Integrated and managed **SOAP-based web services** using **XML schemas** to connect with legacy retail systems such as ERP, CRM, and payment gateways for smooth third-party interoperability.
- Deployed and managed cloud-native retail applications on **AWS**, leveraging **Terraform** for **Infrastructure as Code (IaC)** and configuring **EC2**, **S3**, **Lambda**, **VPC**, and **IAM** for secure, scalable, and fault-tolerant deployments.
- Established and optimized **CI/CD pipelines** using **GitLab CI/CD** with custom runners, integrated with **AWS CodeDeploy** and **EC2** to automate build, test, and deployment workflows, accelerating new feature releases for retail systems.
- Containerized and orchestrated **microservices** with **Docker** and **Kubernetes (AWS EKS)**, ensuring resilient deployments for high-traffic retail events like flash sales, promotions, and seasonal spikes.
- Developed, debugged, and refactored backend code efficiently in **NetBeans IDE** for **AWS**-hosted retail applications, utilizing advanced navigation and refactoring tools to boost developer productivity.
- Ensured consistent code quality by integrating **PMD** for static analysis and managing builds with **Gradle**, enforcing clean code practices across inventory, pricing, and product catalog modules.
- Designed and optimized **PostgreSQL** database schemas to handle high-volume transactional data, integrating **RabbitMQ** for asynchronous order processing, inventory updates, and real-time notification services.
- Administered **GlassFish** application servers, managed version control with **Mercurial**, and tracked bugs and tasks using **Jira**, maintaining seamless collaboration and efficient delivery cycles across distributed retail teams.
- Implemented automated backend tests with **Mockito**, configured structured logging using **Logback** for monitoring order transactions and user interactions, and documented architecture and solutions in **SharePoint** for organizational transparency and onboarding efficiency.

Lumen Technologies, Atlanta, GA

Feb 2014- June 2016

Java Developer

Project Responsibilities:

- Led sprint planning, story estimation, and cross-functional collaboration within an **Agile** environment to deliver high-quality telecom software modules aligned with business goals for network provisioning and subscriber management systems.
- Developed reusable backend components in **Java**, applying core OOP principles such as **Polymorphism** and **Encapsulation** to enhance maintainability and scalability of telecom billing and CRM applications.
- Designed and implemented enterprise-grade web applications using **Spring MVC**, integrating with **Spring Integration** workflows to orchestrate telecom services such as customer activation, plan migration, and real-time usage tracking.
- Built responsive, interactive web interfaces using **HTML5**, **CSS3**, **Bootstrap**, and **JavaScript**, enhancing telecom operator dashboards and customer self-service portals with **Ajax** and **jQuery** for real-time interaction and responsiveness.
- Developed and consumed **SOAP-based web services** using **XML**, enabling interoperability between legacy OSS/BSS systems and modern service provisioning platforms across the telecom ecosystem.
- Designed normalized schemas and optimized data queries in **MySQL**, ensuring data consistency, high availability, and fast query execution for subscriber records, call detail logs (CDRs), and plan configurations.
- Managed automated project builds using **Apache Ant**, configuring custom build scripts for compiling code, managing telecom dependencies, and packaging applications for deployment in multi-tier environments.
- Controlled codebase versioning using **Apache Subversion (SVN)**, managing branching and merging strategies to maintain high code quality and support concurrent development of network management modules.
- Orchestrated end-to-end defect management using **Redmine**, tracking and resolving issues across telecom service workflows such as provisioning, billing, and network integration to maintain high system reliability.
- Created and executed **behavior-driven test scenarios** using **Cucumber**, validating backend logic and frontend interactions for telecom workflows including service activation, usage validation, and billing cycle execution.

Academic Qualifications

- Bachelor's degree in Computer Science, India.

Training & Certifications

- AWS Certified Solutions Architect Associate
- Microsoft Certified Azure AI Engineer
- ServiceNow Certified System Administrator
- ServiceNow Certified Application Developer
