

Rajiv Ranjit

Java Backend Developer

Email: ranjitrajiv95@gmail.com | **Phone:** +1 (510) 859-3641 | **Location:** Richmond, California | LinkedIn

Professional Summary:

As a Java Backend Developer with over 4 years of experience, I specialize in building and optimizing server-side applications, designing scalable microservices, and enhancing backend functionality. Proficient in Java, Spring Boot, Hibernate, and RESTful APIs, I am skilled in delivering high-performance solutions that meet business needs and improve system reliability. My expertise in databases such as MySQL and PostgreSQL, coupled with hands-on experience in CI/CD, cloud deployment (AWS), and version control (Git), enables me to drive streamlined development processes and deliver seamless user experiences.

Technical Skills:

Programming Languages:	Java (8/11/17), Scala, Python, SQL, JavaScript, C, TypeScript
Java/J2EE Technologies:	J2EE, Servlets, JSP, JSTL, JDBC, JavaBeans, Spring Core/MVC/Boot/Data/Security, Hibernate, JPA, Microservices, Log4j, XML, JMS, Web Services, Splunk
Frameworks & Libraries:	Spring Boot, Hibernate, JPA, Microservices, RESTful APIs, Apache Kafka
Databases:	MySQL, PostgreSQL, MongoDB, Oracle, Redis
DevOps & CI/CD:	Jenkins, Docker, Kubernetes, GitLab CI/CD, Maven, Gradle
Software Development Methodologies:	Agile, Scrum, Waterfall, SDLC
Cloud Platforms:	AWS (EC2, S3, RDS, Lambda), Google Cloud Platform
Monitoring & Logging:	Splunk
Project & Collaboration:	JIRA, Confluence, Trello, Slack, Microsoft Teams, Git, Bitbucket

Education:

Masters in Business Administration

Lincoln University, Oakland, CA

Bachelor of Business Administration

Pokhara University, Kathmandu, Nepal

Professional Experience:

Java Full Stack Developer

Sept 2023 - Present

Cisco

Responsibilities:

- Develop and maintain full-stack web applications using Java (Spring Boot), Angular, and RESTful APIs, optimizing application performance and scalability for over 100,000 users monthly.
- Implement robust backend services with Spring Boot and Hibernate, improving response times by 35% through efficient database indexing and query optimization techniques.
- Collaborate with cross-functional teams in Agile sprints, utilizing JIRA and Confluence for tracking progress, creating user stories, and ensuring adherence to project timelines.
- Enhance security protocols using OAuth2 and JWT for secure API interactions, reducing security incidents by 20% through improved authentication and authorization measures.
- Leverage AWS (S3, EC2, Lambda) for cloud deployment and maintenance, reducing infrastructure costs by 15% by optimizing resource utilization and scaling.
- Design and integrate data models in MySQL and MongoDB databases, achieving a 40% improvement in data retrieval speed through query tuning and optimized schema design.
- Utilize Docker and Kubernetes for containerization and deployment, decreasing application deployment time by 50% and ensuring consistency across development and production environments.

- Develop and integrate microservices using Spring Boot and Apache Kafka, enhancing system modularity and reducing interdependency issues by 30%.
- Create unit and integration tests with JUnit and Mockito to ensure code quality and reliability, achieving a 95% code coverage across modules and reducing bugs by 25%.
- Improve front-end performance by implementing lazy loading, minifying assets, and using TypeScript in Angular, resulting in a 20% decrease in page load time.
- Document APIs and system architecture using Swagger and OpenAPI to streamline collaboration with other teams, enhancing project handovers and reducing onboarding time by 30%.

Java Full Stack Developer

Jul 2021 – Aug 2023

Epsilon

Responsibilities:

- Engineered and supported RESTful APIs and microservices utilizing Spring Boot and Java 8/11, enhancing response efficiency by 30% and boosting application scalability for high-demand environments.
- Created responsive web applications with Angular (v10+), JavaScript, and TypeScript, improving user satisfaction and increasing engagement by 20% with intuitive, high-performance interfaces.
- Partnered with UI/UX and backend teams to interpret business requirements into actionable technical solutions, accelerating project timelines by 15% and ensuring cohesive feature implementation.
- Deployed applications on AWS (EC2, S3, RDS, Lambda), achieving 99.9% uptime and ensuring robust application availability and scalability across production environments.
- Enhanced real-time data processing by implementing Apache Kafka for live streaming data, which reduced latency by 40%, contributing to a smoother user experience.
- Reduced deployment cycles by 50% through CI/CD automation using Jenkins, Docker, and Kubernetes, allowing for faster releases and seamless development-to-production transitions.
- Ensured high-quality code and improved maintainability by performing code reviews, applying object-oriented programming principles, and executing unit tests with JUnit, which led to a 20% drop in post-deployment issues.
- Configured Elasticsearch and Kibana to monitor application performance and troubleshoot efficiently, cutting diagnostic time by 30% and enabling proactive system optimization.
- Utilized GitHub for version control and collaborated on project tracking with JIRA and Confluence, ensuring efficient task management and consistent project documentation across teams.
- Structured and optimized complex database queries using MySQL and PostgreSQL, achieving a 35% improvement in response times for data-heavy operations and scaling performance in high-traffic use cases.

Java Full Stack Developer

May 2020 – Jun 2021

Micron Technology

Responsibilities:

- Designed and implemented robust web applications using Java and Spring MVC, optimizing code performance and achieving a 35% decrease in server load times across core applications.
- Partnered with cross-functional teams to build RESTful services with Spring Boot and Hibernate, streamlining data workflows and enhancing inter-team data exchange efficiency by 40%.
- Leveraged React and TypeScript to create dynamic, responsive front-end components, improving user experience metrics by 30% and reducing front-end load times by 20%.
- Employed Oracle SQL and MongoDB to enhance database interactions, reducing query execution time by 50%, which increased overall data processing speed.
- Implemented Kafka for real-time data streaming, enabling reliable data transfer between microservices and reducing latency in key operations by 40%.
- Spearheaded the migration to a microservices architecture with Spring Cloud and Docker, increasing scalability by 45% and enabling smoother updates without downtime.
- Conducted integration and unit testing with JUnit and Selenium, leading to a 30% improvement in early bug detection and maintaining 90% code test coverage.
- Utilized AWS DevOps and CI/CD pipelines to automate build and deployment processes, reducing release time by 40% and enhancing continuous delivery reliability.
- Employed Bitbucket and Git for version control and code collaboration, standardizing code quality across the team and lowering post-release defects by 25%.
- Streamlined communication and project tracking through Asana and Slack, facilitating cross-departmental collaboration and reducing task resolution time by 20%.
