SUMMARY

I primarily focus on web development with ASP.NET Core and have 4+ years of experience, but I've also done legacy and conversion work on federal systems.

EMPLOYMENT

Wells Fargo (Contract)

Senior Software Engineer

February, 2023 – December, 2024

I spent 23 months as a contracted developer on an internal web app written in ASP.NET Core and Angular, along with multiple .NET Core micro-services for that app.

- Utilized Splunk and Elastic APM to monitor and debug production systems using queries and dashboards.
- Championed unit testing and code refactoring with SonarQube, Jest and xUnit. I ensured every release had a minimum of 70% code coverage on changes, and refactored methods/classes as needed. (code smell, complexity, nesting, etc.)
- Handled the technical portion of production requests by doing code research and/or writing one-off SQL to be ran in production.

AcisTek Corporation

Web Developer

March, 2020 – November, 2022

I spent 2 years as a developer for an internal ColdFusion HUD loan tool, then 6 months at USCIS on another ColdFusion app.

- Created a secure REST API to transmit and store confidential information between federal systems, and provided all necessary technical information for the client's security audit.
- Helped with client ad hoc requests by doing code research and/or writing one-off SQL.
- Developed a proof-of-concept port of a mortgage management software module from ColdFusion to ASP.NET Core and Blazor.
- Identified multiple missing database indexes using SSMS query tools and implemented fixes.

SKILLS

Languages – C#, C/C++, SQL, JavaScript, TypeScript, HTML, CSS, Node.js, Xpath, ColdFusion

Apps – Jira, Jenkins, Github, Elasticsearch, Sonarqube, Hashicorp Vault

Frameworks – Bootstrap, Selenium, Jest, xUnit, Angular

Software – Git, Visual Studio, x64dbg, Ghidra, Docker, SQL Server Management Studio, JetBrains Rider, MongoDB, Microsoft SQL Server, Postgres

PROJECTS

C++ IPC Overlay

September, 2019

I reverse engineered the inter-process communication (IPC) on the Steam client's game overlay and developed a method of injecting custom render commands into the data stream. [Link](#)
