

Software Engineer with strong expertise in software development, implementation, and testing across various industries. Skilled in **Java, J2EE, Spring, and microservices architecture**, with expertise in building **RESTful APIs**, database management (**SQL & NoSQL**), cloud solutions (**AWS**), and **CI/CD** pipelines. Proficient in **data structures, algorithms, and design patterns**, ensuring scalable and high-performance solutions while working across all stages of the SDLC.

Technical Skills

Programming Languages	Java, Python, Typescript, JavaScript
Software Methodologies	Agile, Scrum, TDD, SDLC.
J2EE Technologies, frameworks & servers	JDBC, Java 17, Java 8, Java Security, Apache Tomcat, JBoss, OpenShift Container
Web Technologies	Angular, React, HTML, AJAX, Bootstrap, JavaScript, XML, CSS, JSON
Frameworks	Spring, Hibernate ORM, JPA, Spring Core (Dependency Injection), Spring ORM, Spring MVC, Spring AOP, Spring Boot, Spring IOC, Spring, Spring Batch, Spring Security, Spring Data JPA, Spring AMQP, Spring Template
Build Tools & IDE	Maven, Gradle, Eclipse, STS (Spring Tool Suite)
Cloud Technologies, DevOps Tools & Other	AWS, EC2, EKS, S3, Lambda, API Gateway, Cloud Watch, IAM, Secret Manager, Docker, Kubernetes, JIRA, Terraform
Version & Source Control	Git, SourceTree, Bitbucket
NoSQL database	MongoDB, Dynamo DB and Redis
Testing Tools	JUnit, Log4J, Mockito, Swagger, Power Mockito
Messaging Platforms	JMS, Apache Kafka, RabbitMQ

Professional Experience

Verizon Software Engineer

June 2023- Present

- Engineered high-performance microservices to integrate payment gateways, servicing **100,000+** users and reducing transaction processing times by **25%**, resulting in enhanced customer satisfaction.
- Reduced vulnerabilities by fixing known CVEs and patched security flaws in outdated libraries, **reducing vulnerabilities by 80%**.
- Developed a secure **back-end payment system** with AES-encrypted data interfacing and **PCI DSS**-compliant tokenization for optimal data protection, cutting data breach risk by **40%**.
- Implemented backend logic using **Java Collections, Exceptions, Generics, Java 8 Stream API, Date and Time API, Lambda Expressions, Functional Interfaces, Predicates, and Functions**, while managing service requests through **Spring Boot controllers**.
- Worked on **PIE encryption and Tokenization** and **Vulnerability Remediation** project. Designed and built independent **Microservices** for specific business functionalities.
- Designed and implemented backend logic to handle **payment transactions**, ensuring data integrity, encryption, and error handling for successful payments and refunds.
- Migrated** applications from **Java 8 to Java 11**, ensuring improved performance, security, and long-term support (LTS), while also optimizing codebase for enhanced maintainability
- Utilized **Java 8(Core Java)** features such as Lambdas, Streams, and the Date and Time API, along with **Java 11** features like Completable Futures, and **Java 17** enhancements such as Sealed Classes and Pattern Matching for switch.
- Implemented **RESTful APIs** using **Spring MVC** for seamless communication between microservices.
- Developed dynamic web applications using **Angular**, incorporating RxJS, directives, and two-way data binding, and enhanced code quality with **TypeScript** for type safety.
- Implemented asynchronous communication pattern using **Kafka** for improved responsiveness and fault tolerance.
- Built robust error handling mechanisms providing meaningful error responses with appropriate HTTP status codes.
- Integrated the API into a CI/CD pipeline with docker and Kubernetes for automated testing, building, and deployment.

Texas Tech University Health Science Center Software Engineer

Sep 2021- March 2023

- Developed **microservices** for patient and appointment management systems, providing functionalities for registration, profile updates, scheduling, history tracking, and appointment operations reducing appointment booking times by **40%**, directly benefiting **500+** healthcare professionals.
- **Migrated** from **Java 7** to **Java 11** for both microservices and legacy applications to leverage long-term support (LTS) and improve application security, **increasing overall system reliability by 40%–60%**.
- Implemented custom exception classes for **API's** business logic, enhancing code clarity, reducing error resolution time by **30%**.
- Implemented **HIPPA** and **HL7** standards for secure and standardized healthcare information exchange between Electronic Health Records (EHR) systems and third-party applications.
- Optimized and Improved system responsiveness by integrating **AWS Redis** caching, reducing server loads by **60%** and enabling real-time patient data retrieval.
- Applied **microservices design patterns** such as Circuit Breaker, SAGA, and CQRS, and utilized Amazon API Gateway to enhance system performance, fault tolerance, and scalability.
- Implemented **input validation** for patient data entry forms using **Angular's form validation** including template-driven and reactive forms, along with built-in and custom validators, to create user-friendly and error-free data entry interfaces.
- Utilized Angular's **HTTP Client** module for efficient **REST API calls**, integrating **OAuth 2.0**, **JWT**, and **Spring Security** to secure the data, ensuring that only authorized users could access or modify relevant information.
- Wrote **Database** objects like Triggers, Stored procedures in SQL. Generating Reports using Batch Process and UI developed using jQuery. Strong expertise in **Core Java**, including **OOP**, **Collections**, **Multithreading**, and **Exception Handling**.
- Developed declarative **I/O** operations within **Spring Batch**, streamlining the reading, processing, and writing of large volumes of data. Integrated **Spring's transaction management** to ensure data consistency and reliability during **batch processing**,
- Leveraged **IAM roles** for permissions management across AWS services and resources, while also utilizing **AWS Secret Manager** for secure credentials storage and implementing monitoring through Amazon **CloudWatch** for AWS services.
- Orchestrated **CI/CD pipelines with Jenkins, Git, JFrog, Maven**, integrating **SonarQube** and **FindBugs** for rigorous code quality checks. Containerized Spring Boot applications for efficient deployment on **AWS ECS** and **EKS**, optimizing scalability.

CodeSlice IT Solutions

June 2017 –

July 2021

Software Engineer

- Developed a robust **transaction microservice** managing 50,000+ daily transactions with **99.9%** uptime, minimizing operational costs.
- Integrated third-party **payment gateway** into microservice, adeptly managing responses. Implemented robust error handling to manage responses from the payment gateway, guaranteeing secure and reliable transaction processing.
- Built a microservice to manage a range of banking transactions, such as deposits, withdrawals, fund transfers, and balance inquiries. Additionally, I contributed to tasks related to payment activities, including processing incoming and outgoing payments, monitoring payment statuses, and ensuring the security of financial transactions.
- Implemented **Singleton design pattern** for optimal database connection reuse, reducing overhead and improving system responsiveness.
- Developed web-based applications using Spring modules including **Spring Boot**, **Spring MVC**, **Spring Security**, **Spring AOP**, and **Spring Data JPA**, incorporating best practices for scalability and security.
- Created routing components for the application using the **react-router** module for various components and **views**. Worked on **React JS**, **Redux**, and **React views**, rendering using **class components** for effective data transmission via **props**.
- Utilized **microservices architecture** with Spring Boot, facilitating seamless interactions between services.
- Implemented **Swagger API** for auto-generated **REST** call documentation, promoting transparency and collaboration.
- Worked with **OAuth clients** and **resource servers**, **JWT** to handle authentication and access control.
- Configured job definitions, steps, readers, processors, and writers for **batch processing using spring batch** to handle large-scale data processing and **ETL** tasks.
- Worked on **Log4J** to capture the log that includes **runtime exceptions**, monitored **error logs**, and **fixed the problems**.

Education

Masters in computer science at Texas Tech University

Aug 2021 - May 2023

Bachelors in computer science at Visvesvaraya Technological University

Aug 2013 - June 2017
