

Ramana Gurijala

ramana.g3@gmail.com | 945-289-8442 / 214-892-0368

Professional Summary:

- 14+ years in Software Testing, specializing in Banking, Financial Services, and Healthcare.
- Skilled in manual and automation testing (Web, API, SOA).
- Strong knowledge of SDLC, STLC, BLC, Agile, and Waterfall models.
- Hands-on experience in Functional, Regression, Smoke, Ad-hoc, Compatibility, and Performance Testing.
- Proficient in Selenium, Cucumber (BDD), TestNG, Postman, CA LISA, and Jenkins , Workday Integrations Testing.
- Experience in writing Cucumber feature files, Java step definitions, and using XPath and Page Object Model (POM).
- Strong understanding of SOAP, REST, XML, and WSDL.
- API testing experience with Postman and CA LISA.
- Skilled in SQL, PL/SQL, Teradata, and ETL testing (Informatica, DataStage).
- Experience in data validation and backend testing.
- Integrated automation tests into CI/CD pipelines using Jenkins.
- Experience with JMeter for unit-level validation and bottleneck identification.
- Extensive experience using JIRA and HP Quality Centre for test case management and defect tracking.
- Managed automation testing projects and led cross-functional teams.
- Mentored juniors, allocated resources, and improved testing processes.
- Knowledge of Unix/Linux/Windows environments.
- Quick adaptability to new technologies with a strong focus on quality and efficiency.

Education:

- Bachelor of Technology, Electrical & Electronics, JNTU Kakinada University, India -Aug 2006 to May 2010.

Certifications:

- ISTQB Certification
- Azure SQL Developer
- DataStage Certified Developer 8.5
- Professional Scrum Master 1 Certification
- Agile way of foundation

Susash Consulting Services: (Feb 2025 – Till Now) – Quality Assurance Lead

Responsibilities:

- Analysed business requirements and developed testing strategies, plans, and detailed test cases for the Application Under Test (AUT).
- Created high-level scenarios for each feature/user story.
- Parameterized Selenium WebDriver scripts to test application behaviour with multiple data sets.
- Integrated test suites with Jenkins for automated execution after each successful deployment.
- Reported and tracked defects using JIRA, verified bug fixes, and updated bug status.
- Collected and analysed test metrics, providing reports on testing status and progress.
- Worked on functional, regression, smoke, and integration testing to ensure application stability.
- Automated test cases using Selenium WebDriver with TestNG and Cucumber frameworks.
- Conducted API testing using Postman and validated responses with assertions.
- Performed database testing using SQL queries to validate backend data integrity.
- Used XPath and CSS selectors for dynamic object identification in Selenium.
- Developed reusable automation scripts to improve efficiency and reduce execution time.

- Ensured seamless collaboration between QA, development, and business teams for issue resolution.
- Maintained and updated existing test scripts to accommodate application changes.

Tools:

Java, Selenium WebDriver, Cucumber, BDD, Eclipse, TestNG, Jenkins, Git, Agile, Quality Centre, HP ALM, Jira, X ray, Cyara, SQL, Postman, Workday Integrations

Tata Consultancy Services: (Mar 2011 – Feb 2025) – Assistant Consultant

Client: LLOYDS BANKING GROUP, UK: Jun 2017 – Feb 2025

Role: QE – Test Manager, Test Lead and Test Analyst and Workday Integration Test Lead

NGCC – Next Generation Customer Contacts (IVR) is a major transformation program initiated by LBG to enhance interactive, employee-friendly applications using the latest technologies. As a vendor, we understood the customer's objectives and provided support across the entire QE space, including web application testing, API testing, security testing, parallel browser testing, accessibility testing, and load testing. We delivered reusable automation components to improve efficiency and reduce costs while minimizing the budget by leveraging open-source tools wherever possible.

Responsibilities: IVR Testing (Functional and Automation), Web Testing, API Testing (CALISA, Postman), Automation using Selenium

- Project Planning: Develop the project plan, covering key elements such as schedule, scope, requirements, risk, quality, communication, stakeholder management, effort estimation, and resource planning.
- Seek review and feedback from the Program/Engagement Manager and the customer, as necessary.
- Requirements Understanding: Comprehend the high-level requirements.
- Plan and monitor work packages within scope.
- Identify and manage dependencies within and between work packages.
- Ensure the readiness of requirements for handover to the Technical Lead and the team.
- Identify any gaps between the requirements and the anticipated scope and milestones.
- Execute automated test cases using the CYARA Tool.
- Prepare and present status reports to stakeholders, including conducting management reviews.
- Organize and lead defect triage calls, entry gate calls, and obtain signoffs from the customer.
- Serve as the primary point of contact for project-related updates and communication with the client.
- Address client issues and provide appropriate solutions.
- Coordinate with relevant stakeholders such as the onsite project team, horizontal teams, client team, Delivery Manager, and Program Manager.
- Resolve conflicts and support team-building activities.
- Provide administrative support as needed.
- Contribute to goal setting and performance appraisals for team members.
- Identify skill gaps and training requirements and offer support for improvement.
- Assist in defining learning and career development plans for team members.
- Nominate team members for awards.
- Conduct training through the academy and facilitate the induction of new team members.
- Establish contingency backup plans for critical roles.
- Identify reusable assets for the project.
- Review and share best practices or innovations across the group.
- Engage with the Community of Practice to address business challenges encountered during the project.

Responsibilities: Workday Integration Test Lead

Had 2 years of experience in Lloyds Bank client with Workday functional and Integration test Lead to ensure working with **Workday integrations**, especially in the context of HR, finance, and payroll systems, different roles have specific responsibilities to ensure that data flows correctly between Workday and other internal/external systems (e.g. SAP, third-party benefits providers (SHL)).

- Manage timelines, scope, and delivery of integration projects with Workday.
- Coordinate between HR IT, finance, vendors, and integration teams.

- Conduct stakeholder meetings and risk assessments.
- Oversee documentation, testing, and deployment planning.
- Gather and analyse business requirements for Workday integrations with SHL Third Party Supplier.
- Collaborate with stakeholders to define integration needs.
- Configure Workday delivered connectors and integration templates.
- Validate end-to-end data flow and support Functional/UAT testing.
- Coordinate data mapping between Workday and external systems.
- Write and execute test plans for Workday integrations and Candidate Recruitment and Assessment journey.
- Validate inbound and outbound files/data.
- Perform negative testing, boundary testing, and performance testing.
- Document defects and work with developers to resolve issues using X ray/Jira.
- Provide API or file interface specs for integration.
- Receive or send data to/from Workday (e.g., benefit Providers, payroll systems using SAP).
- Participate in end-to-end testing and cutover planning using Agile methodologies.
- Ensure timely updates for format or schema changes.
- Maintain the test artefacts (Master Test Plan, End of Test Report) in the jira confluence page and Test Plans and Test Executions using X-ray /Jira.

Responsibilities: API Testing (CALISA, Postman)

- CALISA provides an API for integration, automation, or data exchange
- Understand CALISA's API endpoints, authentication mechanisms, and data models.
- Design and execute API test cases (positive, negative, edge cases).
- Handle Validate API responses (status codes, headers, payload, formats like JSON/XML).
- Use tools like Postman, SoapUI, or automation frameworks like Rest Assured, JMeter, etc.
- Document test results and report bugs or anomalies.
- Ensure APIs comply with RESTful standards and expected behaviour.
- authentication (OAuth, API Keys) and encryption for secure API interactions.
- Translate functional requirements into API test scenarios.
- Verify that API responses align with business logic and asset management rules.
- Validate workflows involving CALISA APIs (e.g., asset creation, status update, data handover).
- Help define acceptance criteria for API-based features.
- Approve API functionality based on test results along with Product Owner.
- Prioritize API issues based on business impact.
- Coordinate between testing teams and CALISA support/vendor.
- Ensure API coverage aligns with system integration needs.
- Integrate API tests into CI/CD pipelines.
- Monitor API uptime and performance via automated scripts.
- Use tools like Jenkins, GitLab CI for continuous testing.
- Generate test reports and metrics for every deployment.
- Automated the Web Self-Serve web application using Selenium.

Client: Western Union, USA: Aug 2013 – Jun 2017

Role: Automation and ETL Test Lead

The Western Union is a leader in Global Payment Services and provides consumers and businesses with fast, reliable and convenient ways to send and receive money worldwide in 200 countries, to send payments and to purchase money orders. Western Union includes services for consumer-to-consumer and consumer-to-business and business-to-business.

Responsibilities:

- Understand DB project requirements and generate a questionnaire to capture all requirements.
- Review and ensure requirements are clear, unambiguous, and testable.
- Design the test program, test plan, and test scripts for all scenarios in scope.
- Create test scenarios, test cases, and perform risk analysis on test cases.

- Identify test data requirements and perform impact analysis on change requests.
- Build a regression test suite for future testing and prepare test strategy, metrics, and reports.
- Perform API testing for RESTful and SOAP APIs, validating responses, security, and performance.
- Automate API tests using tools like Postman, SoapUI, and validate integration with databases.
- Validate ETL processes, ensuring correct data extraction, transformation, and loading into target systems.
- Perform data quality checks, validate data integrity, and ensure performance of ETL processes meets requirements.

Client: Chrysler, USA: Dec 2012 – Aug 2013

Role: ETL Test Engineer

The project involves the development of a Business Intelligence (BI) application for Chrysler's Service-Marketing division, specifically focused on the Canadian market. The main goal is to bring in repair order data from Chrysler dealers across Canada, providing senior management with valuable insights through trend analysis and marketing strategies. The project facilitates the loading of repair order data into a centralized database, which is then analysed for marketing purposes across various dealers. This system manages and processes several terabytes of assimilated data to support decision-making and marketing efforts.

Responsibilities:

- Analyse and generate performance observations, providing recommendations.
- Develop DataStage parallel and sequence jobs for ETL processes.
- Design and develop the database to store repair orders for Canadian dealers.
- Work on performance tuning for DataStage jobs to optimize processing.
- Design the test program, test plan, and test scripts for all in-scope scenarios.
- Responsible for loading data into DB2 database.
- Conduct data validation and quality checks to ensure accurate loading and processing.
- Perform data reconciliation between source and target systems to identify discrepancies.
- Test data extraction, transformation, and loading processes to ensure proper data flow and accuracy.
- Create and maintain ETL test cases for functional, regression, and performance testing.
- Automate ETL testing using tools like DataStage, Informatica, or Talend.
- Ensure ETL processes meet data quality standards, including completeness, consistency, and accuracy.
- Perform integration testing to ensure seamless interaction between ETL processes and other systems.
- Validate error handling and recovery mechanisms within ETL processes.
- Review ETL logs and error reports to identify issues and ensure they are addressed during testing.

Client: Target Corporation, USA: Mar 2011 – Dec 2012

Role: Production Support Executive

Target, the second-largest general retailer in the United States, operates across three divisions: Target, Mervyn's California, and the Department Store Division. The Information Services division of Target has undertaken a major restructuring initiative to consolidate the information systems of these three divisions into a single unified system. As part of this effort, TCS provides 24/7 support for the development of Business Intelligence (BI) applications that aid senior management in sales forecasting, identifying guest preferences, trend analysis, and marketing strategies across various communication channels. This includes maintaining several terabytes of assimilated data across a range of applications, such as E-Commerce, Stores, Planning, Forecasting, Distribution, HR, Team Member, and Financial Suites.

Responsibilities:

- Design test plans, test suites, and test scripts for all in-scope scenarios.
- Responsible for loading data into DB2 and ensuring data integrity.
- Compile and debug test results within project SLAs.
- Generate overview and detailed test reports, including Non-Functional Requirements checklists.
- Provide performance observations and recommendations for optimization.
- Participate in client reviews and walkthroughs during project initiation.
- Prepare estimations and plans for development, testing, delivery, and deployment of permanent fixes.
- Perform code or procedure changes in the production environment, ensuring minimal disruption.

- Raise RFCs (Requests for Change) for production changes and coordinate with teams like DBA for successful implementation.
- Prepare and maintain test suites, including test data and test cases.
- Analyse and resolve client issues via Remedy, providing permanent solutions within SLAs.
- Maintain and enhance Target's Business Intelligence applications
- Transition application knowledge to new team members, including technical and system knowledge.

Tools:

Cyara (IVR Automation Tool), Telephony (IVR application), Workday, Workday Integrations with SHL, SQL, PL/SQL, Teradata, DataStage, HP Quality Center, JIRA, Xray, Cyara Cruncher, Velocity, IVR Testing, IVR Automation, DWH Testing, ETL Testing, Business Objects, Postman, CA LISA, Data Warehouse, Informatica, Mainframes, AS400, API Testing, SQL Developer, Oracle 10g, DB2, Unix, Control-M, ServiceNow.
