Contact: +1 (984)-232-7890

LinkedIn: <https://www.linkedin.com/in/shaikabdukhadar1/>

Professional Summary:

- Accomplished Senior Full Stack Java Developer with over 11 years of experience designing, developing, and maintaining enterprise-grade applications across diverse industries, leveraging advanced Java frameworks and modern cloud-native technologies.
- Expertise in building scalable, high-performance Java applications using **Java SE/EE, Spring Boot, Hibernate, and Microservices architecture**, ensuring optimized workflows and faster delivery of new features.
- Adept in developing and consuming RESTful APIs and web services while ensuring compliance with enterprise integration standards and enhancing cross-functional communication between distributed systems.
- Designed and developed backend services and lightweight APIs using Node.js and Express.js to improve performance and scalability in microservice architectures.
- Strong exposure to **Event-driven architectures** with hands-on implementation of Kafka-based streaming pipelines to deliver real-time data processing and optimized message-driven applications.
- Proven ability to optimize application performance through **complex SQL/NoSQL queries, stored procedures, and query tuning** across databases such as PostgreSQL, Oracle, MySQL, and MongoDB.
- Proficient in functional programming concepts and object-oriented programming, which are foundational to Scala development.
- Experience with multi-threading, concurrency-safe modules, and event-driven architectures, which are transferable to Scala-based applications.
- Familiarity with JVM-based languages (Java) and frameworks, enabling seamless adoption of Scala for big data and distributed systems.
- Configured and automated AWS resource provisioning workflows using Amazon Resource Orchestrator (ARO) to manage EC2, S3, and Lambda deployments.
- Skilled in **cloud platforms (AWS, Azure, GCP)** with expertise in serverless computing, container orchestration, and Infrastructure-as-Code using Terraform and AWS CloudFormation.
- Experience with **containerization and orchestration** using Docker and Kubernetes, enabling faster deployments, cost optimization, and greater scalability of production workloads.
- Leading experience integrating **DevOps pipelines (Jenkins, GitLab CI/CD, Maven, Gradle)** to drive automated builds, continuous integration, and seamless software deployments.
- Hands-on experience with building large-scale ETL workflows and data preprocessing pipelines using Python, which can be extended to Spark for distributed data processing.
- Expertise in **real-time event streaming pipelines** using Apache Kafka, which is often integrated with Spark for big data analytics.
- Knowledge of **distributed computing principles and parallel processing**, which are essential for working with Apache Spark.
- Hands-on experience designing, deploying, and managing enterprise microservices on **Microsoft Azure**, leveraging services such as **Azure Kubernetes Service (AKS), App Service, and Azure Functions** for scalable, cloud-native application delivery.
- Proficient in **Azure DevOps Pipelines and YAML-based CI/CD automation**, enabling secure, zero-downtime deployments across multi-region environments.
- Implemented **Azure Service Bus, Event Hub, and API Management (APIM)** to build event-driven and API-first architectures with real-time data streaming, throttling, and observability.
- Experience with **Azure Data Factory (ADF), Cosmos DB, and Azure SQL Database** for high-volume ETL workflows, transactional data persistence, and analytics integration.
- Integrated **Azure Key Vault and Managed Identity** for secrets management and role-based security, ensuring compliance with HIPAA, PCI-DSS, and internal governance standards.
- Skilled in **Azure Monitor, Log Analytics, and Application Insights** for telemetry, performance tuning, and predictive alerting across distributed Java and AI/ML workloads.

- Advanced expertise in software engineering practices including **test-driven development (TDD/BDD)**, **automation testing frameworks (JUnit, Cucumber, Karate)**, and static code quality monitoring.
- Extensive experience across **Agile methodologies (Scrum, Kanban, XP)**, actively contributing to sprint planning, backlog refinement, and cross-functional Agile ceremonies.
- Recognized for spearheading modernization of **legacy monolithic systems** into microservices and cloud-native solutions, streamlining performance, reducing costs, and improving maintainability.
- Experienced in designing **scalable AI/ML integrated modules** in recent years, enabling smarter business workflows and predictive analytics in cloud-based applications.
- Proficient in **Python programming for AI, ML, and automation**, with hands-on experience in **TensorFlow, PyTorch, Scikit-learn, NumPy, and Pandas** for developing, training, and deploying predictive models.
- Designed **Python-based data pipelines** for large-scale ETL, feature engineering, and preprocessing across SQL, NoSQL, and streaming data sources.
- Developed **REST APIs using FastAPI and Flask** to expose machine-learning inference and analytics services, integrating seamlessly with Java Spring Boot microservices.
- **Automated CI/CD, testing, and deployment workflows** with Python scripting and tools such as **Jenkins, Azure DevOps, and GitHub Actions**, reducing manual overhead and improving delivery speed.
- Built and optimized **ML workflows in the cloud** using **AWS SageMaker, Azure ML, and Google Vertex AI**, enabling scalable model training and deployment pipelines.
- Applied Python for **data analytics and visualization**, leveraging Matplotlib, Seaborn, and Plotly to generate business insights and performance dashboards.
- Implemented **Python-based automation for monitoring and log analysis**, integrating with Prometheus, Grafana, and ELK Stack to improve observability and incident response.
- Skilled in **multi-language collaboration**, using Python for AI and automation alongside **Java, TypeScript, and SQL** to deliver cross-platform, cloud-native enterprise applications.
- Strong ability to **troubleshoot and debug complex production issues**, applying advanced problem-solving strategies that significantly reduce incident resolution times.
- Excellent implementation skills in **security-by-design principles, OAuth 2.0, JWT tokens, and identity management frameworks** to secure web applications and services.
- Contributed to designing **enterprise-level API strategies** with OpenAPI, JSON, GraphQL, and SOAP solutions, bridging modern and legacy system integrations efficiently.
- Adept in real-time **application monitoring, logging, and observability tools** like ELK Stack, Splunk, Prometheus, and Grafana to identify bottlenecks and improve system reliability.
- Experienced in working across global delivery models (onsite & offshore), mentoring distributed teams, and collaborating with architects and leadership for high-value outcomes.
- Successfully engaged in **proof-of-concept projects and technical prototyping**, validating system designs and delivering scalable enterprise solutions.
- Strong background in **front-end integration** with Angular and React, ensuring seamless communication between interface layers and backend microservices.
- Led multiple Agile teams through **digital transformation initiatives**, ensuring accelerated delivery and improved client-grade experiences for stakeholders and users.
- Hands-on experience developing **serverless applications using AWS Lambda, Step Functions, and API Gateway** to deliver cost-effective cloud-native services.
- Extensively engaged in **performance benchmarking activities**, achieving measurable improvements in latency, throughput, and scalability for critical enterprise applications.
- Expertise in **messaging systems** including Kafka, RabbitMQ, ActiveMQ, and JMS, ensuring high throughput message-driven applications capable of handling large-scale traffic.
- Demonstrated ability in **data migration projects**, transforming and modernizing legacy data sources to cloud-native storage systems like AWS DynamoDB, S3, and RDS.
- Effective stakeholder communication and requirements gathering, bridging the gap between business intent and technical execution for enterprise-grade digital solutions.
- Recognized for delivering **risk-mitigated software deployments with zero-downtime CI/CD rollouts**, leading to resilient, business-continuity-focused solutions.
- Strong contributions in **enterprise integration platforms** ensuring secure hybrid-cloud connectivity across SaaS, on-premise, and multi-cloud environments.

- Keen researcher of emerging Java trends, **AI-driven automation**, cloud-native modernization patterns, and microservices best practices, consistently driving innovation within global teams.

Technical Skills:

Category	Skills
Programming Languages	Java SE/EE (11, 17, 21), Python (AI/ML integrations), JavaScript (ES6+), TypeScript
Frameworks	Spring Boot, Spring MVC, Spring Cloud, Hibernate/JPA, Struts, React, Angular, nodejs
Cloud Platforms	AWS, Azure, GCP, Lambda, Step Functions, API Gateway, CloudFormation, Terraform, AWS amplify, ARO
Databases	PostgreSQL, Oracle, MySQL, MongoDB, DynamoDB, Redis, Cassandra
Microservices	RESTful APIs, GraphQL, SOAP, OpenAPI, Event-driven Architecture
Messaging Systems	Apache Kafka, RabbitMQ, ActiveMQ, JMS, Azure Service Bus, Event Hub
DevOps Tools	Jenkins, Git, GitLab CI/CD, Maven, Gradle, Chef, Ansible, SonarQube
Containers	Docker, Kubernetes, OpenShift
Testing Tools	JUnit, Mockito, Cucumber, Karate, Postman, Selenium, TestNG
AI/ML Integration	TensorFlow APIs, ML pipelines on AWS SageMaker, AI-driven automation for Java workflows
Monitoring Tools	ELK Stack, Splunk, Prometheus, Grafana, Dynatrace
Security	OAuth 2.0, JWT, SSL/TLS, KeyCloak, Spring Security
Version Control	Git, Bitbucket, GitFlow, GitHub
Deployment Models	Blue-Green Deployment, Canary Deployments, Rolling Updates
Collaboration Tools	JIRA, Confluence, Slack, MS Teams, Agile Boards

Work Experience:

Client: Visa, Foster City, CA

Dec 2023 - Present

Role Title: Senior Full Stack Java Developer

Responsibilities:

- Designed and implemented scalable Java microservices on Spring Boot, enabling real-time processing of payment transactions with sub-millisecond latency for global financial clients.
- Led integration of AI/ML models for fraud detection and risk analysis, collaborating with data science teams to operationalize predictive scoring in transaction workflows using TensorFlow and AWS Sage Maker.
- Implemented unit and integration testing for Node.js REST APIs using tools such as Mocha and Jest, ensuring robust code quality under Agile/CI-CD workflows.
- Collaborated with front-end developers to build full-stack JavaScript applications by integrating React.js with Node.js services for seamless user experiences.
- Developed advanced real-time event streaming pipelines with Kafka, orchestrating billions of events across distributed systems while ensuring high throughput and data consistency.
- Architected RESTful APIs following OpenAPI specifications, facilitating secure and extensible integration for partner banks and fintech platforms worldwide.
- Enhanced backend systems with robust algorithms and data structures for transaction validation, anomaly detection, and real-time processing, improving system accuracy and reliability.
- Developed containerized applications using Docker and deployed on Kubernetes clusters, enabling immediate scalability and resilient service orchestration.
- Improved CI/CD pipelines using Jenkins and GitLab, integrating extensive unit, integration, and AI model validation tests to maintain production quality and accelerate delivery.
- Utilized Google Cloud Build, Cloud Run, and IAM policies to streamline CI/CD automation and ensure secure deployment workflows.

- Integrated ARO workflows with CloudFormation and AWS Code Pipeline for seamless continuous delivery and automated rollback mechanisms.
- Leveraged Amplify's CLI for provisioning backend services (API Gateway, S3, Cognito) and enabling rapid prototype deployment for client demos.
- Deployed and managed Spring Boot microservices on Azure Kubernetes Service (AKS), achieving optimized load balancing, automatic scaling, and simplified cluster management.
- Implemented Azure Application Gateway and API Management (APIM) to secure and monitor API traffic, ensuring compliance and throttling control across partner integrations.
- Configured Azure Monitor and Log Analytics for centralized logging and telemetry, enhancing visibility into transaction performance, latency, and ML model health metrics.
- Collaborated closely with security teams to apply multi-layer encryption, OAuth2.0 flows, and compliance controls, safeguarding sensitive payment data in accordance with PCI-DSS standards.
- Created reactive and Event-driven services using Spring WebFlux to handle massive concurrent connections while maintaining service-level agreements for uptime and response time.
- Integrated backend microservices with Google Cloud Spanner for distributed relational data, ensuring high consistency and low-latency queries for transaction metadata.
- Built and optimized SQL queries for Spanner, leveraging partitioning and indexing strategies for scalable analytics and reporting.
- Utilized Amplify's CI/CD pipelines for automated front-end deployments, ensuring faster rollouts and tighter integration into microservice-based cloud ecosystems.
- Advocated for cloud-native architecture best practices, introducing Infrastructure-as-Code (Terraform) for consistent environment provisioning on AWS.
- Engaged in API gateway configurations (AWS API Gateway) to secure, throttle, and expose services effectively to various internal and external consumers.
- Developed Python-based ETL scripts for automating data extraction, transformation, and ingestion into Kafka and PostgreSQL, streamlining analytics and ML workflows.
- Created Python REST APIs with FastAPI to integrate AI inference services with existing Java microservices, reducing response latency by 20%.
- Automated model retraining and validation workflows using Python scripts orchestrated through Jenkins and Azure DevOps, enabling continuous model improvement.
- Participated in pilot programs integrating GraphQL APIs to enhance data query flexibility and reduce network payloads for complex front-end applications.
- Researched emerging technologies including AI-powered automation tools and blockchain payment frameworks, proposing innovative product enhancements.
- Partnered with UX teams to address accessibility and usability improvements in payment portals, ensuring inclusive design principles.
- Championed knowledge-sharing sessions focused on AI/ML integration and cloud-native Java application development, elevating team skill levels continuously.

Environment Skills: Java 17, Spring Boot, Spring WebFlux, Angular, Kafka, PostgreSQL, AWS (Lambda, API Gateway, Sagemaker), Docker, Kubernetes, Jenkins, Terraform, TensorFlow, Cucumber, Karate, Prometheus, Grafana, OAuth2.0, PCI-DSS, GraphQL, Agile/Scrum.

Responsibilities:

- Led the design and development of scalable healthcare analytics modules using Java Spring Boot microservices, supporting Humana's real-time claims processing and patient management applications.
- Integrated advanced AI/ML components using AWS SageMaker and TensorFlow APIs to automate anomaly detection and predictive analytics for insurance claims and patient outcomes.
- Architected and implemented RESTful APIs for secure exchange of health records and insurance data with partner systems, ensuring HIPAA compliance and data integrity.
- Developed web interfaces with Angular, enabling seamless front-end integration and highly interactive dashboards for case managers and healthcare professionals.
- Developed Angular TypeScript front-end modules with RxJS-based reactive programming, achieving faster data updates in real-time claims dashboards.
- Optimized complex SQL and NoSQL queries for high-volume transactions on Oracle, PostgreSQL, and MongoDB databases, supporting efficient data retrieval and real-time decision making.
- Configured Kafka streaming to enable real-time event processing for alerts, claims status updates, and member notifications, improving operational responsiveness.
- Automated ETL workflows using batch processing jobs, facilitating the migration and transformation of millions of member records across distributed storage systems.
- Implemented CI/CD using Jenkins, achieving reliable automated testing, integration, and near-zero downtime deployments for critical business modules.
- Leveraged Azure Data Factory (ADF) to orchestrate ETL workflows and synchronize healthcare data across on-prem and cloud repositories, ensuring high data integrity.
- Designed and deployed microservices on Azure App Service and Azure SQL Database, supporting low-latency, secure healthcare applications with auto-scaling capabilities.
- Applied Azure Key Vault for secure management of API keys, certificates, and secrets, strengthening compliance with HIPAA and internal security policies.
- Built gRPC microservices leveraging Protocol Buffers for low-latency, schema-based data interchange between core healthcare systems.
- Developed secure authentication and authorization layers using Keycloak and Spring Security, ensuring robust protection for sensitive health and insurance information.
- Orchestrated multi-functional Agile teams through Scrum methodologies, driving continuous delivery of new features and fast adaptation to evolving business needs.
- Led the technical migration of legacy ASP.NET modules to Java-based microservices, enhancing maintainability and lowering future technical debt.
- Designed high-throughput Kafka-based event pipelines for claims eligibility validation, achieving scalable, near-real-time processing for over 2 million daily events.
- Built automated regression and performance testing frameworks with JUnit, Cucumber, and Postman, ensuring code coverage and quality across all releases.
- Prepared business process documentation, API reference guides, and technical onboarding materials for developers, business analysts, and third-party partners.
- Implemented encryption and data masking procedures for stored member records, maintaining compliance with federal and state-level data protection regulations.
- Developed interactive dashboards and reporting modules in Angular for business stakeholders, allowing real-time access to actionable insights and system health metrics.
- Leveraged Docker containers for application deployment and environment isolation, enabling consistency between development, QA, and production systems.
- Managed daily production support, investigating incidents, and resolving critical outages or performance bottlenecks with efficient root cause analysis.
- Piloted AI-driven chatbots and virtual assistants for member support channels, improving customer engagement and automating routine inquiries.
- Participated in continuous performance benchmarking using JMeter and custom profiling scripts to guarantee application stability under peak loads.
- Led code review sessions and mentorship programs for new engineers, sharing best practices in microservices

construction, AI integration, and cloud security.

- Coordinated with regulatory specialists to meet certifications, policy audits, and security accreditation for insurance platform modules.
- Developed and maintained Agile sprint boards in JIRA, tracking progress and managing deliverables for distributed teams across multiple states.
- Implemented Python-based data cleaning and normalization routines to process millions of healthcare records across Oracle and MongoDB repositories.
- Utilized Python TensorFlow and PyTorch frameworks to train predictive models for patient risk scoring and insurance claim fraud detection.
- Automated data validation, anomaly detection, and performance reporting using Python, improving compliance accuracy and system reliability.
- Collaborated with external technology partners for third-party API integration, facilitating seamless data exchange and joint feature development.
- Researched emerging AI automation trends, guiding innovation roadmap and technology adoption within Humana's digital modernization program.
- Supported disaster recovery planning, backup automation, and test drills for mission-critical applications, ensuring business continuity for members.
- Created custom middleware libraries for secure, audited invocations of AI models, simplifying integration and monitoring across microservices.
- Reduced incident response times through improved monitoring, alerting, and automated log aggregation with ELK and custom notification workflows.
- Facilitated technical workshops and cross-team Hackathons, promoting continuous learning, AI/ML upskilling, and innovative solution development for healthcare teams.

Environment Skills: Java 11, Spring Boot, Angular, REST APIs, Oracle, PostgreSQL, MongoDB, Kafka, AWS, Terraform, Jenkins, ELK Stack, JMeter, Docker, KeyCloak, SageMaker, TensorFlow, Cucumber, Postman, JIRA, Agile/Scrum.

Client: New York State Department of Health, Albany, NY

Nov 2018 – May 2021

Role Title: Full Stack Java Developer

Responsibilities:

- Led development of mission-critical healthcare modules on a Spring Boot microservices architecture, ensuring high reliability and regulatory compliance for patient data management systems.
- Designed and maintained RESTful APIs for interdepartmental integration, enabling seamless and secure communications between legacy systems, mobile apps, and web portals.
- Implemented front-end features using ReactJS and integrated them with Java backend services, enhancing user experience for healthcare professionals and public users.
- Contributed to Angular component development and modernization efforts aligned with Boq-like UI frameworks for public health reporting portals.
- Developed Spanner-optimized SQL and gRPC endpoints for high-throughput health record retrieval across distributed data centers.
- Collaborated with cross-functional teams in Agile sprint planning and code reviews, ensuring adherence to enterprise-grade Google Cloud standards.
- Built and optimized complex SQL queries and stored procedures in PostgreSQL for large-scale population health reporting, supporting data-driven decision making in public health initiatives.
- Modernized legacy reporting solutions through incremental migration to microservices, improving system availability, scalability, and supportability.
- Automated test suites using JUnit, Selenium, and Postman, achieving high coverage and drastically reducing regression risk during monthly release cycles.
- Facilitated multidisciplinary Agile teams through sprint planning, backlog refinement, and daily stand-ups, driving rapid delivery of new features throughout the pandemic.
- Developed concurrency-safe modules for high-throughput applications processing medical claims and patient inquiries, preventing data corruption and service downtime.
- Refactored monolithic codebases into reusable library packages, enabling new project teams to launch health

initiatives quickly and securely.

- Optimized CI/CD pipelines in Jenkins and GitLab, accelerating release cycles, and enabling zero-downtime deployments for regulatory reporting systems.
- Supported multi-cloud deployment strategies, migrating select modules to AWS and Azure for disaster recovery, cost optimization, and future scalability.
- Participated in stakeholder reviews and solution design workshops, translating public policy goals into actionable technical deliverables.
- Researched and piloted machine learning models to predict healthcare trends, integrate anomaly detection, and prioritize emerging health threats for policymakers.
- Provided mentorship and led technical workshops for junior developers, supporting upskilling in modern Java, React, cloud, and security practices.
- Authored detailed business process documentation and API usage guides in Confluence, improving system knowledge across public health departments.
- Facilitated UAT cycles and coordinated with business analysts to gather feedback from actual healthcare practitioners, ensuring feature validity and usability.
- Developed secure file upload/download modules for patient forms, enabling encrypted transfer and archiving of sensitive records.
- Automated database migrations and schema updates with Flyway, reducing risk and ensuring schema consistency for new deployments.
- Supported high-volume API endpoints for vaccination scheduling, testing registration, and patient data exchange, handling spikes during public health emergencies.
- Implemented role-based access controls and granular permissions to maintain HIPAA and state privacy compliance across all modules.
- Resolved production incidents related to scaling, session management, and real-time reporting, reducing issue resolution times for statewide systems.
- Designed prototype dashboards using React/Redux, demonstrating interactive analytics and customizable visualizations for policy leaders.
- Customized Kafka-based event streaming for cross-agency notifications and real-time data dissemination for emergency response teams.
- Advocated for adoption of new technologies, including containerization with Docker/Kubernetes and cloud-based analytics, successfully piloting these upgrades in two statewide modules.

Environment Skills: Java 11, Spring Boot, RESTful APIs, ReactJS, PostgreSQL, Oracle, Jenkins, GitLab, Docker, Kubernetes,

ELK Stack, Apache Kafka, JUnit, Selenium, Postman, Spring Security, Flyway, Confluence, Agile/Scrum, Cloud (AWS, Azure), Apache POI.

Client: Comcast, Philadelphia, PA

May 2016 – Oct 2018

Role Title: Senior Java Developer

Responsibilities:

- Led the design and migration of monolithic client applications to microservices using Spring Boot and Spring Cloud, significantly improving maintainability and scaling efficiency for nationwide digital platform operations.
- Prototyped Angular and TypeScript integrations with Java Spring microservices for modernization initiatives.
- Designed proof-of-concept modules integrating Google Cloud Spanner with Kafka-based event pipelines for scalable data persistence.
- Architected and developed RESTful APIs for seamless data exchange between distributed modules, enabling real-time integration and service orchestration for business-critical communications.
- Spearheaded the adoption of Apache Kafka for Event-driven data pipelines, allowing for scalable real-time messaging, transaction logs, and advanced analytics integration across global teams.
- Implemented advanced security protocols including OAuth2.0 and JWT for user authentication, protecting sensitive client data across all application endpoints.
- Designed and optimized SQL queries and database schemas in Oracle and PostgreSQL to enable high throughput and low latency for enterprise reporting and transaction management.
- Collaborated closely with DevOps and QA teams to integrate Jenkins CI/CD pipelines facilitating automated

builds, unit/integration testing, and on-demand release management.

- Utilized Docker for containerization, streamlining environment setup, dependency management, and deployment consistency for multi-region systems.
- Coordinated API versioning and service discovery using Spring Cloud and Netflix OSS, enabling seamless upgrades and reducing downtime during rollout cycles.
- Automated regression test suites using JUnit, Mockito, and Selenium to validate stability and reliability of new releases before production deployment.
- Implemented end-to-end monitoring, alerting, and log aggregation through ELK Stack, enabling quick root cause analysis and incident recovery.
- Led onsite-offshore collaboration efforts, managing distributed development teams, facilitating effective standups, retrospectives, and sprint demos.
- Generated and managed UML diagrams for technical design and business process mapping, streamlining communication between architects and business stakeholders.
- Developed enterprise-grade API documentation and tutorials for both internal and external development partners, supporting broader digital transformation initiatives.
- Wrote Python automation scripts to streamline API testing, build verifications, and CI/CD quality gates, reducing manual intervention in deployment workflows.
- Created Python utilities for log analysis and performance monitoring, integrating with ELK Stack and Prometheus to identify latency bottlenecks proactively.
- Researched and recommended adoption of new frameworks and tools—including Spring WebFlux and OpenAPI—accelerating innovation in client products.
- Oversaw parallel deployments using blue-green and canary strategies, minimizing downtime and ensuring robust rollback capabilities.
- Coordinated SOX compliance and security audits for cloud services, ensuring every release met regulatory and data governance standards.
- Reduced legacy debt by refactoring core modules to adopt code modularization, interface-driven design, and comprehensive unit testing.
- Facilitated technical guidance and mentorship programs for junior engineers, conducting code reviews and deep dives into advanced Java development.
- Supported multiple business units by customizing scalable integration solutions for customer management, billing, and support channels.
- Resolved critical production issues related to concurrency, deadlocks, and high-availability clustering for core backend platforms.
- Enabled multi-tenant capabilities in core ecommerce modules, allowing Comcast to support partner integrations at scale.
- Fostered Agile culture by actively contributing to sprint planning, backlog grooming, and cross-functional showcases to drive high-impact delivery and user satisfaction.

Environment Skills: Java 8/11, Spring Boot, Spring Cloud, Oracle, PostgreSQL, Apache Kafka, JMS, Docker, Kubernetes, Jenkins, SonarQube, ReactJS, ELK Stack, Confluence, JUnit, Selenium, OAuth2.0, JWT, UML, Netflix OSS, JMeter, Gatling.

Client: Accenture/Comcast, Chennai, India

Dec 2011 – Apr 2016

Role Title: Java Developer

Responsibilities:

- Developed enterprise-grade Java applications leveraging J2EE frameworks such as Struts and Spring, ensuring robust deployment for high-availability business processes and internal platforms.
- Designed and maintained JSP, Servlets, and MVC modules for web applications to enhance user interactions and business logic handling, ensuring seamless integration with legacy ERP systems.
- Created dynamic reporting features using JDBC, SQL, and PL/SQL for real-time data analytics to aid management decision-making across multiple departments.
- Enhanced application performance by optimizing database queries and refining stored procedures within Oracle, resulting in faster data retrieval and improved transaction reliability.
- Integrated external RESTful APIs to enable real-time data feed from external partners, supporting business workflow automation and inter-system communication.

- Built batch processing modules for daily ETL, data normalization, and archival, ensuring compliance with internal audit and data retention standards.
- Maintained code repository using SVN and adopted best practices for version control, branching, and release management across distributed teams.
- Collaborated with front-end teams to deliver integrated features using HTML, CSS, and JavaScript, providing enhanced experiences for end users on web platforms.
- Assisted in migration projects for legacy data from flat files and mainframe sources to relational databases, ensuring data integrity and business continuity.
- Implemented error handling frameworks and custom logging solutions for real-time alert monitoring, supporting rapid incident response processes.
- Actively participated in SDLC phases, including requirements gathering, use case analysis, technical design, development, code review, and deployment, adhering to industry standards.
- Conducted regular code reviews to enforce design patterns, improve modularity, and optimize resource utilization, ensuring consistent code quality on all modules.
- Automated repetitive QA tasks through scripting and test automation frameworks, resulting in significant time savings during release cycles.
- Integrated authentication and authorization modules using LDAP and proprietary user management systems, upholding compliance with regulatory requirements.
- Developed multi-threaded applications to improve responsiveness and facilitate concurrent processing for time-sensitive financial transactions.
- Implemented SOAP-based web services enabling B2B communication for bulk data transfers and business workflow automation with external vendors.
- Provided production support and incident management for 24x7 business systems, resolving high-priority issues within defined SLAs.
- Participated in business operations improvement projects, leveraging system configuration changes and module enhancements to improve productivity.
- Produced root cause analysis reports as part of response teams, including detailed recommendations for preventing recurrence of system-level bugs and downtime.
- Facilitated UAT cycles and coordinated with stakeholders to validate functional and non-functional requirements before go-live, reducing risk and rework.
- Drove continuous improvement initiatives, researching and recommending emerging Java technologies and tools to enhance team productivity and product stability.

Environment Skills: Java SE/EE, Struts, JSP, Servlets, Apache Tomcat, WebLogic, SVN, Oracle, PL/SQL, Hibernate, HTML, CSS, JavaScript, JUnit, SOAP, REST, Confluence, LDAP, SQL, Multi-threading.
