

Himal Gyawali

Java Full Stack Developer | 513 - 440 - 0164 | gyawalihimal72@gmail.com | [LinkedIn](#)
USA

Professional Summary

Java Full Stack Developer with over 6 years of experience building scalable enterprise and cloud-based applications using Java, Spring Boot, and Angular. Skilled in developing microservices, RESTful APIs, and event-driven architectures with Kafka and Resilience4j. Experienced in deploying containerized solutions to AWS using Docker and CI/CD pipelines, with a strong focus on security, performance monitoring, and clean, test-driven code. Collaborates effectively in Agile teams to deliver reliable, high-quality software solutions.

Technical Tools

Programming Languages: Java 8–21, TypeScript, JavaScript, SQL, HTML5, CSS3, Bash

Frameworks: Spring Boot, Spring MVC, Spring Data JPA, Spring Security, Struts, RxJS, Resilience4j, Hibernate

Front-End Tools: Angular 8–19, Angular CLI, Lazy Loading, Interceptors, Angular Material, jQuery, Swagger, Bootstrap, RESTful APIs, JSON

Databases: MySQL, PostgreSQL, MongoDB, DynamoDB, Redis

Messaging & Streaming: Kafka, Kafka Streams, JMS, Dead-Letter Queues

Cloud & DevOps: AWS (EKS, ECS, Lambda, EC2, S3, CloudWatch, Parameter Store, API Gateway, RDS, IAM), Fargate, Helm, CI/CD Pipelines

Containerization: Docker, Kubernetes, Apache Tomcat, JBoss, OpenShift, Terraform

CI/CD & Build Tools: Jenkins, GitHub Actions, Maven, Gradle, Bitbucket Pipelines

Monitoring & Logging: Splunk, CloudWatch, Log4J, OpenTelemetry, Grafana, Prometheus, ELK Stack

Testing: JUnit, Mockito, JMeter, Postman, SonarQube, Cucumber

Security: OAuth2, JWT, RBAC, Spring Security, AWS KMS, LDAP

Version Control & Collaboration: Git, GitHub, GitLab, JIRA, Confluence, Bitbucket

Automation & Scripting: Linux Shell Scripts, Python Scripts, Cron Jobs, Ansible

Education

Master of Science in Computer Science
Miami University, Oxford, OH

Professional Experience

Sabre

Jan 2025 – Present | TX, USA

Role: Java Full Stack Developer

Project: *Flight Operations Management Platform*

Developed a **Spring** Boot and **Angular** based platform for managing flight scheduling, crew assignments, and operational tracking across **airline** services. Worked on backend **microservices** to handle schedule

synchronization and data processing between multiple internal systems. Designed frontend dashboards with **Angular** to visualize live operational data and improve coordination between airline departments.

Responsibilities:

- Built **Java 21** microservices using **Spring Boot** to automate backend processing by using Spring Profiles for configuration management and Spring Actuator for health tracking.
- Designed **RESTful APIs** in **Java** to manage inter-service requests by defining structured response models and validation layers for consistent integration.
- Built modular **Angular 16/19** interfaces using **TypeScript**, gradually adopting **Angular 19**'s new control flow syntax and improved Signals **API** to enhance reactive UI updates.
- Developed dashboards with **HTTP** interceptors for token handling and Material components for responsive and accessible user interactions.
- Configured **Kafka topics** to manage asynchronous communication between services by enabling schema validation and offset tracking for reliable event delivery.
- Designed relational data models using **MySQL** to manage transactional workflows and optimize query performance through indexed joins and JPA based object mapping.
- Used the same **MySQL** database for audit tracking and reports with partitioned tables and scheduled jobs to maintain consistency.
- Implemented **NoSQL MongoDB** collections to store audit records by using aggregation pipelines for reporting and analysis across microservice logs.
- Implemented **OAuth2** and **JWT** security to establish **RBAC** access control by using Spring Security filters for endpoint protection.
- Developed **Angular** modules with lazy loading to improve application startup time, introducing standalone components of **Angular 19** for cleaner module structure and improved build performance.
- Created automated tests with **JUnit** and **Mockito** to verify repository and controller behavior for consistent build validation.
- Built **Docker** images to containerize applications for deployment through **Jenkins CI/CD** pipelines running in **AWS ECS** environments.
- Collaborated with frontend developers to align **Swagger** contracts with Angular services for real-time operational dashboards.
- Created **Java**-based microservices with **Resilience4j** circuit breaker and fallback logic to maintain service continuity during dependent system failures.
- Implemented **Kafka** Streams and partitions for real-time data processing and event aggregation across backend services.
- Deployed Spring Boot microservices to **Kubernetes** using **Terraform** for infrastructure provisioning and **Helm** for managing rollouts and versioned deployments of containerized services.
- Configured **AWS Lambda functions** to process scheduled jobs by using **Parameter Store** for runtime property injection.
- Managed routing through **API Gateway** and **AWS EC2** load balancers to optimize request handling for deployed Spring Boot services.

- Developed **automation utilities** in **Python** to schedule maintenance jobs, trigger API tests, and manage configuration updates through **cron job** scripts for deployment workflows.
- Added **Redis** caching to improve read-heavy API response times by reducing load on relational databases and improving system throughput.
- Monitored performance using **Splunk** dashboards and **OpenTelemetry** traces to detect latency issues and analyze distributed transaction flow.
- Configured **AWS CloudWatch** dashboards and custom **metrics** to monitor ECS tasks, Lambda executions, and API Gateway latency for proactive performance tracking.
- Used **SonarQube** to analyze code quality by identifying complex methods and duplication patterns to maintain clean and maintainable **Java** codebases.
- Managed release branches in **GitHub** for production deployments, integrating with **Jenkins CI/CD** pipelines for automated builds.
- Managed **Jira** user stories and sprint tasks to maintain end-to-end traceability and alignment between development, QA, and deployment teams.
- Participated in **Agile** sprints to coordinate tasks with DevOps and QA for efficient deployments and smooth communication during delivery.

Technological Environment:

Java 21, Angular 16, Angular 19, Spring Boot, Spring Profiles, Spring Beans, Spring Actuator, RESTful APIs, TypeScript, Angular Interceptors, Lazy Loading, Kafka, Resilience4j, MySQL, NoSQL, MongoDB, AWS ECS, AWS Lambda, AWS Parameter Store, API Gateway, Docker, CI/CD pipelines, Jenkins, GitHub, Swagger, Python, Kubernetes, Terraform, Helm, JUnit, Mockito, OpenTelemetry, distributed tracing, OAuth2, JWT, RBAC, SonarQube, Jira, Agile methodology

Carta

Jan 2024 – Dec 2024 | CA, USA

Role: Java Full Stack Developer

Project: *Equity Management Application*

Built an **equity management** system using **Java Spring Boot** and **Angular** to manage shareholder records, stock grants, and valuation updates for corporate clients. Developed backend services to process transactions, maintain historical data, and generate audit-ready reports. Created dynamic **Angular** interfaces to present portfolio metrics and ownership structures for business users.

Responsibilities:

- Developed **Java 11** Spring Boot modules with **DTO** mapping to support uniform data transfer within microservice architecture.
- Refactored legacy **Java** modules into smaller **microservices** to introduce service orchestration and version management for faster independent releases and scalability.
- Built dynamic **Angular 14** modules using **RxJS** and lazy loading to improve data flow and reduce initial page load time.

- Developed **RESTful APIs** with **Spring Boot** and API Gateway routing to control internal communication and enable reliable cross-service integration.
- Built data access layers using **Spring Data JPA** to manage transactional operations in PostgreSQL databases.
- Built adaptive **JWT** authentication architecture supporting dynamic token validity, refresh intervals, and role-based claims to ensure scalable and compliant access management.
- Implemented **OAuth2** authorization using Spring Security to enable secure logins and token-based API control.
- Built **Kafka producers** using **Spring** Boot to publish asynchronous event messages with custom partition keys and acknowledgment handling for reliable delivery.
- Optimized **SQL** queries and indexing to speed up report generation and analytics, improving overall system performance.
- Designed and implemented a centralized **PostgreSQL** database to manage client data with consistent, secure, and integrated access.
- Automated builds and **deployment** pipelines through **CI/CD** using **Jenkins** to maintain continuous testing and container delivery in AWS **ECS** clusters.
- Built and maintained **Docker** images for Spring Boot services, optimizing layers to reduce image size and accelerate deployments in **AWS ECS**.
- Applied **Spring Boot** validation rules with custom **Java** utilities to validate incoming requests for cleaner controller and service interaction.
- Developed scalable data models in **DynamoDB** to support high volume event persistence with optimized read/write performance for real time reporting.
- Integrated **Redis** caching layer with **PostgreSQL** and **DynamoDB** backends to optimize read-heavy microservices.
- Developed reusable **Angular** components using **TypeScript** decorators and reactive forms to simplify UI validation and improve modularity.
- Configured **Kafka Streams** applications with partition-aware processing and failover routing through dead-letter topics to maintain consistent message reliability.
- Performed backend testing with **JUnit** and **Mockito** to verify service logic and detect defects during integration.
- Conducted load testing using **JMeter** to validate concurrent request handling for stable backend throughput under heavy traffic.
- Optimized **Lambda** performance by reducing cold starts and managing environment variables through AWS Parameter Store.
- Enhanced **Angular** functionality with **TypeScript** and **JavaScript** logic to reduce rendering latency and improve data communication between components.
- Implemented **CloudWatch** alarms and Log Insights to monitor **ECS** container health, Lambda cold starts, and API latency, enhancing incident detection and reducing mean time to resolution.
- Configured and managed **S3** buckets for secure file storage, versioning, and lifecycle management.
- Executed modernization of monolithic **Java** and AngularJS applications to scalable **Angular**-based micro frontends for simplified maintenance and deployments.

- Deployed and managed containerized applications using **AWS ECS** with Fargate for serverless container orchestration.
- Resolved complex merge conflicts and rebases in **Git** to maintain clean and consistent code history.
- Integrated **Swagger** UI and JSON documentation in **CI/CD** builds for automatic version updates and deployment to the internal API Gateway.
- Established centralized **logging** through Splunk pipelines to collect API events for faster debugging and production monitoring.
- Maintained sprint boards and epics in **JIRA Agile**, tracking API development, bug fixes, and refactor tasks.
- Contributed to **Agile** sprints to maintain clear **communication** between developers, QA teams, and stakeholders for aligned delivery objectives.

Technological Environment:

Java 11, Angular 14, Spring Boot, Spring Validation, Spring Beans, Spring Data JPA, RESTful APIs, JWT, OAuth2, API Gateway, Microservices Architecture, TypeScript, JavaScript, RxJS, Lazy Loading, Kafka Streams, MongoDB, DynamoDB, PostgreSQL, AWS ECS, AWS Lambda, AWS S3, Jenkins CI/CD, Swagger, Docker, JUnit, Mockito, JMeter, Splunk, CloudWatch, modernization, legacy migration, performance optimization, Git, Jira, Agile methodology

Cotiviti

Feb 2019 – Jul 2023 | Utah, USA

Role: Java Developer

Project: *Healthcare Claims Processing System*

Developed a **Java Spring MVC** and **Angular** based claims platform to process healthcare transactions and identify billing inconsistencies for payer organizations. Built backend components to validate claim data, manage adjudication logic, and store processed results in **PostgreSQL** databases. Designed responsive frontend pages using **Angular** to display claim status, payment details, and audit information.

Responsibilities:

- Developed **Java-based MVC** modules using **Spring** and JSP controllers to create structured internal workflows by applying **Java 8** patterns for scalable enterprise systems.
- Built **Angular 8** and **Angular 10** components using **reactive forms** and validation logic in **TypeScript** to support reusable UI elements for business applications.
- Created **SOAP** endpoints defined with **WSDL** and schema validation to exchange **XML** data across enterprise services by using controlled serialization standards.
- Developed relational data models in **PostgreSQL** to support microservice interactions and ensure reliable persistence across distributed applications.
- Implemented **PostgreSQL RDS** instances with performance monitoring, encryption, and snapshot-based recovery for secure and reliable data management.
- Implemented **RESTful APIs** with **Spring Boot** to connect new microservices with legacy **Struts** modules so that older JSP layers function with modern data flows.

- Built **Spring Boot** middleware to issue and validate **JWTs** and configured **OAuth 2** flows to enable stateless authentication and secure API communication.
- Used **JavaScript** and **jQuery** to design interactive UI scripts by applying **custom AJAX** operations for real-time updates and faster data presentation in dashboards.
- Developed **XML parsing** and transformation logic using DOM and SAX methods to transfer structured data between systems for vendor and internal integration needs.
- Tuned **PostgreSQL queries**, indexing, and partitioning to improve data retrieval performance and support large-scale transactional workloads.
- Applied **JUnit** and **Mockito** testing for backend validation to confirm controller logic, service stability, and integration between dependent **Java** layers.
- Handled deployment of **WAR** builds on **Tomcat** servers to automate continuous delivery by using Linux shell scripts and **Jenkins CI/CD** pipelines.
- Validated request/response payloads against **Swagger** schemas to maintain consistent service behavior during modernization efforts.
- Developed front-end layouts using **HTML**, **CSS**, and **JavaScript** to integrate **JSTL** templates with backend **API** calls for responsive application pages.
- Configured **LDAP** and form-based login flows with role mapping in order to create secure access layers for multi-level administrative modules.
- Set up **Log4J** and Splunk monitoring to collect runtime logs for audit and troubleshooting by using filters to trace system-level activities.
- Managed **Git** repositories in Bitbucket using clear branching strategies for development and releases.
- Participated in **JIRA** sprint planning to estimate story points and prioritize high-impact backend features.
- Worked in an **Agile** Scrum team, contributing to sprint planning, daily stand-ups, and retrospectives to coordinate with QA and business teams for timely and high-quality releases.

Technological Environment:

Java 8, Angular 8, Angular 10, Spring MVC, Spring Boot, JSP, Struts, SOAP, WSDL, XML Configs, RESTful APIs, Swagger, JWT, OAuth2, TypeScript, JavaScript, jQuery, AJAX, PostgreSQL, Log4J, Splunk, LDAP, Jenkins CI/CD, WAR Deployments, Tomcat Server, JUnit, Mockito, Git, Linux Shell Scripts, Jira, Agile Environment
