

AMOS PRESTON

SENIOR FULL STACK ENGINEER

Tampa, FL | amosp912@outlook.com | 813-755-3260

PROFILE

Experienced Senior Full Stack Software Engineer with over 10 years of extensive experience designing, building, and deploying scalable, cloud-native applications. Expert in Golang and Python with strong proficiency in React, Docker, and AWS. Adept at leveraging modern architectures, microservices, DevOps practices, and collaborative Agile methodologies while delivering robust, maintainable software solutions.

PROFESSIONAL EXPERIENCE

Senior Software Engineer, STG	October 2023 — Present
- Architected and implemented stateless microservices leveraging Golang and Docker, resulting in highly scalable transaction processing systems that handle millions of requests per day. - Designed and developed automation tools and RESTful APIs in Python, Django, FastAPI, reducing deployment errors and operational overhead by 40% through enhanced CI/CD pipelines leveraging AWS CodePipeline. - Integrated React front-ends with Python-based API backends, enabling seamless real-time data visualization dashboards for internal and external users. - Spearheaded cloud migration projects by containerizing legacy applications in Docker, Kubernetes and deploying them to AWS ECS, improving system reliability and reducing infrastructure costs. - Mentored junior engineers, performing rigorous code reviews and guiding best practices for test-driven development, code refactoring, and effective Git workflows. - Collaborated with security teams to implement robust API authentication and authorization using OAuth2 and JWT, fortifying user data protection. - Successfully led Agile squads, facilitating sprint planning, backlog grooming, and cross-functional communication for faster feature releases. - Developed and tuned monitoring solutions using Prometheus and Grafana, resulting in a 35% reduction in mean time to resolution for critical incidents. - Authored comprehensive system documentation, including API references and runbooks, ensuring knowledge continuity for engineering teams. - Optimized SQL and NoSQL database queries to enhance transaction throughput and reduce latency across highly-available cloud environments.	
Senior Backend Engineer, Veeva	March 2020 — September 2023
- Engineered backend microservices in Go and Python that improved messaging throughput and reduced message latency for user interactions at scale. - Built and maintained CI/CD pipelines with Docker and GitLab CI, accelerating software release cycles and reducing deployment rollback incidents by 30%. - Developed frontend features using React in close coordination with UX/UI and product teams, ensuring high customer satisfaction scores for usability. - Utilized AWS Lambda for serverless event processing, enabling cost-effective scaling for time-sensitive notifications and integrations. - Participated in design reviews and helped shape architectural decisions towards cloud-native patterns, container orchestration, and microservice reliability. - Ensured code quality and maintainability by enforcing robust unit, integration, and end-to-end testing strategies, and using tools like Pytest and Go testing frameworks.	

- Automated infrastructure provisioning with Terraform and CloudFormation, improving environment consistency across development and production systems.
- Assisted with database schema design, data migrations, and optimization of PostgreSQL and DynamoDB workflows for high-velocity SaaS requirements.
- Contributed to operational readiness by implementing application monitoring, error tracking with Sentry, and self-healing scripts for fast incident remediation.
- Documented system requirements, deployment guides, and contributed to internal wikis, supporting knowledge sharing and onboarding.

Full Stack Software Engineer, AltSource

January 2015 — March 2020

- Designed and built RESTful APIs and backend components in Python to support global voice and messaging platforms with tight performance SLAs.
- Implemented real-time data ingestion and stream processing pipelines leveraging Kafka, ensuring low-latency communication for millions of endpoints.
- Utilized Docker Compose and custom build scripts to orchestrate development environments, accelerating onboarding and reducing environment drift.
- Worked closely with DevOps to containerize legacy services and automate deployments on AWS ECS and EC2 instances, improving uptime and operational efficiency.
- Optimized and debugged distributed systems using profiling and tracing tools, lowering 95th percentile latencies by 20% in key microservices.
- Collaborated with QA to automate regression tests with Selenium and PyTest, ensuring code reliability and quick detection of production issues.
- Leveraged Git for source control, instituting branching strategies and pull request practices that increased team productivity and codebase quality.
- Emphasized rigorous error handling, logging, and alerting frameworks to facilitate fast troubleshooting and robust operational support.
- Presented technical solutions and best practice guidelines during engineering all-hands and internal brown bag sessions.
- Supported continuous improvement by staying current with emerging development patterns, tools, and languages in backend and cloud ecosystem.

EDUCATION

Bachelor's degree in CS

September 2010 — June 2014

University of Toronto

TECHNICAL SKILLS

Golang	Python	GORM	Django Flask
Fast API	React	Docker	Kubernetes
Microservices	REST API	CI/CD	SQL / NoSQL
Cloud Computing	AWS Technologies	Prometheus	Grafana
PostgreSQL	Infrastructure as Code	Terraform	Redis
Distributed Systems	Automation Testing
