

OBJECTIVE

Seeking a challenging role in a dynamic environment where I can continuously enhance my skills, expand my knowledge and contribute meaningfully to the growth and success of the organization.

PROFESSIONAL SUMMARY

- Oracle Certified Java Developer with 7 years of experience in designing and developing scalable server-side applications using **Java, Spring Boot, and Microservices** architecture.
- Worked in **Agile** teams using Scrum methodology and managed tasks, sprints, and user stories through **JIRA, Rally** for efficient project tracking and collaboration.
- Extensive experience in monitoring and troubleshooting distributed applications using industry-leading observability tools including **Datadog, Kibana, Dynatrace, and Splunk**.
- Configured custom dashboards and alerts in **Datadog** to monitor application health, performance metrics, and infrastructure usage in real-time.
- Designed and implemented **Kibana Watchers** to monitor critical application logs and trigger real-time alerts based on custom-defined thresholds and error patterns.
- Experience with message brokers such as **Apache Kafka and RabbitMQ** for asynchronous communication.
- Hands-on experience with **Docker** for containerization and **Jenkins** for building robust CI/CD pipelines.
- Hands-on experience deploying, managing, and scaling containerized applications using **Kubernetes** and enterprise-grade platforms like **Red Hat OpenShift**.
- Proficient in AWS services including **EC2, Elastic Beanstalk, Lambda, S3, RDS, CloudWatch, EBS, ECS, EKS, Route 53, VPC, Storage gateway, CloudFront**.
- Implemented asynchronous communication between microservices using **Apache Kafka and RabbitMQ**, improving system scalability and decoupling
- Implemented distributed caching using **Redis** to enhance application performance.
- Strong understanding of **OAuth 2.0** for secure authentication and authorization in microservices.
- Implemented **Spring Scheduler** to automate recurring tasks such as data processing, cleanup jobs, and system health checks in microservices.
- Implemented **Spring AOP** to modularize cross-cutting concerns such as logging, exception handling, and performance monitoring.
- Proficient in Spring ecosystem including **Spring REST, Spring Data JPA, Spring JDBC, Spring Security, and Spring OAuth2**.
- Applied core **Design patterns** across multiple Spring Boot microservices to ensure consistent architecture, improve code reusability, and enhance maintainability.
- Database expertise in **Oracle 11g, IBM DB2, and NoSQL databases like Couchbase**.
- Led successful migration of Spring Boot applications from **PCF to OpenShift**, including spring boot version upgrades and Gradle build enhancements.
- Proficient in build tools like **Maven and Gradle**, version control using **GitHub, Bitbucket** and **GitLab**.

- Expertise in cloud-native development, including **Cloud Config Server, Circuit Breaker patterns, and Retry mechanisms** in distributed systems.
- Implemented standardized API documentation across multiple Spring Boot microservices using **OpenAPI Swagger** improving developer onboarding, integration efficiency, and API discoverability.
- Developed web applications using **Spring MVC** and front-end technologies like Angular and React.js.
- Quick to adapt to new technologies and environments with a strong focus on continuous learning.

PROFESSIONAL EXPERIENCE

- I worked as **Senior Consultant** with **Capgemini**, Kolkata. **(Sep 2017 to Jan 2024)**
- Worked as **System Engineer** with Insight Global, Hyderabad. **(Jan 2017 to Sep 2017)**

PROFESSIONAL CERTIFICATIONS

- Oracle Certified Java Programmer (OCJP Java SE 6).
- Oracle Certified Java Web Services Developer.

TECHNICAL SKILLS

Programming Languages:	Java
JEE Technologies	Servlets, JSP
JSE Technologies	JDBC, JNDI
Web Technologies	HTML, JavaScript, CSS, JavaScript, Angular, React Js, Redux.
XML Technologies	XML, XSD, JAX-B
Data bases:	Oracle, Postgres SQL, Db2, SQL Server and Couchbase.
Servers	Apache Tomcat, IBM Web Sphere.
Frameworks:	Spring Boot, Spring DATA, Spring Rest, Microservices, OAuth2 Spring (Core, JDBC, Aspect J AOP, Tx Management, MVC, ORM, Security), Spring Schedulers, Apache Kafka, Rabbit MQ, Cloud Config Server, Circuit Breaker (Hystrix, Resilience4j), Redis Distributed Cache Restful Web Services, Soap Web Services, Hibernate.
IDE's	Eclipse, STS, IntelliJ, Visual Studio Code
Container Orchestration	OpenShift, Docker, Kubernetes, Helm charts.
Tools	
Observability Tools	Datadog, Kibana, OpenSearch, Dynatrace, Splunk.
Other Tools	Jira, Postman, SQL Developer, WinSCP, Putty
Build Tools	Maven, Gradle, Junit, Mockito, SL4J

Versioning Tools	Git, Git Bash, Bitbucket.
CICD Tools	Jenkins

PROJECT EXPERIENCE:

1. **Project:** EICE Banking Collections DPL (Aug 2023 – Jan 2024)

Description: This is a spring-boot microservices based application split across different modules, which serves as the back end for the EICE. The EICE application is used by the customer support team of Discover Bank. This Project is to build a micro-services architecture to deliver a next-generation customer experience. ECS contains different microservices to support discover personal loans and to provide hardship features to their customers.

Technologies: Java 17, Spring Boot, Microservices, Apache Kafka OpenShift, Kubernetes, Datadog, Oracle, Db2.

Role : Onshore Developer

Methodology: Agile

Responsibilities:

- Developed and maintained Helm charts to standardize and automate the deployment of microservices across multiple environments.
- Created and managed Kubernetes ConfigMaps and Secrets to externalize configuration and securely handle sensitive data such as API keys and credentials.
- Configured OpenShift Routes to expose services externally with secure TLS termination and custom hostname mappings.
- Led the upgrade of Spring Boot applications across multiple environments, ensuring compatibility with newer versions and leveraging enhanced features and security improvements.
- Successfully migrated applications from older Java versions (e.g., Java 8) to Java 17, resolving deprecated APIs and optimizing performance.
- Migrated Apache Kafka SSL certificates from application class path to a secure HashiCorp Vault path, enhancing certificate management, rotation, and runtime security.
- Upgraded application caching strategy from in-memory cache to distributed caching using Redis, improving scalability, fault tolerance, and performance in a microservices environment.
- Implemented standardized API documentation across multiple Spring Boot microservices using OpenAPI (Swagger), improving developer onboarding, integration efficiency, and API discoverability.
- Involved in developing web client to invoke other microservices, implemented circuit breaker pattern using resilience 4j and applying retry mechanisms, rate limiter, time limiter patterns.
- Involved in developing Rest Template to invoke other microservices and utilized internal service mesh URL for internal communication.
- Refactored the core compliance evaluation component, consolidated checks to improve efficiency and overall application performance.
- Migrated legacy mainframe DAP services to modern Spring Boot microservices, enhancing scalability, maintainability and performance.
- Replaced legacy SOAP integrations with modern RESTful APIs, significantly improving performance, scalability and maintainability.
- Integrated and monitored services via Datadog and Kibana, creating alerts and watchers for technical failures and business validation errors.
- Implemented JWT-based security for newly onboarded banking collection services and registered them

- with provider/consumer portals.
- Enhanced code quality by resolving SonarQube-reported issues and elevating services to meet higher quality gate standards.
- Developed BDD test cases using Cucumber, increased unit test coverage with JUnit, and evaluated code coverage with JaCoCo to ensure robust test quality.
- Onboarded services to Sealights to assess and enhance behavioral test coverage, driving improved software quality and reliability.
- Analyzed cloud cost optimization strategies by leveraging Datadog telemetry from Spring Boot applications to improve resource efficiency and reduce expenses.
- Resolved vulnerabilities identified in Nexus IQ scans, ensuring secure and stable builds in the CI/CD pipeline.
- Fixed code quality issues identified by SonarQube, improving maintainability and reducing technical debt across multiple services.
- Developed comprehensive unit tests using JUnit and Mockito, and implemented acceptance tests using Cucumber to validate business logic and ensure end-to-end functionality.

PROJECT EXPERIENCE:

2. Project: Extra care - (July 2022 – Aug 2023)

Description: This is a spring-boot microservices based application split across different modules, which serves as the back end for the CVS Extra Care is a loyalty program offered by CVS. It provides customers with various benefits, discounts, and rewards for shopping at CVS stores.

Technologies: Spring Boot, Microservices, PCF, OpenShift, Docker, Kubernetes, Redis and Rabbit MQ.

Role : Onshore Developer

Methodology: Agile

Responsibilities:

- Analyzed business requirements and implemented optimal solutions aligned with architectural best practices.
- Migrated Spring Boot applications from Pivotal Cloud Foundry (PCF) to OpenShift Container Platform, ensuring seamless deployment and scalability.
- Upgraded Spring Boot and Java versions across multiple services, resolving deprecated APIs and enhancing performance and security.
- Migrated in-memory caching to Redis distributed cache, implementing cache eviction strategies to improve scalability and performance.
- Created and managed Kubernetes ConfigMaps and Secrets in OpenShift to externalize and secure application configurations.
- Developed non-invasive messaging solutions using Spring Cloud Stream with RabbitMQ for asynchronous communication.
- Implemented OpenAPI/Swagger documentation across microservices to improve API discoverability and developer onboarding.
- Built resilient microservices using Spring WebClient, implementing Resilience4j patterns such as circuit breaker, retry, rate limiter, and time limiter.
- Developed internal service communication using RestTemplate and service mesh URLs for secure and efficient microservice interaction.
- Authored Kubernetes deployment configurations using Docker and integrated with Jenkins CI/CD pipelines for automated deployments.
- Implemented SSO using Keycloak for centralized authentication and authorization.
- Resolved Nexus IQ vulnerabilities and pipeline issues in Jenkins to ensure secure and stable builds.
- Addressed code quality issues identified by SonarQube, improving maintainability and reducing technical debt.

- Integrated JaCoCo for code coverage analysis in Spring Boot applications, ensuring test completeness.
- Wrote comprehensive unit tests using JUnit and Mockito, and acceptance tests using Cucumber to validate business logic.
- Performed API testing and validation using Postman to ensure functional and contract compliance.
- Involved in unit testing using Postman.

PROJECT EXPERIENCE:

3. Project: EICE Banking Collections DSL – Discover Bank (Mar 2020 – June 2022)

Description: This is a spring-boot microservices based application split across different modules, which serves as the back end for the EICE. The EICE application is used by the customer support team of Discover Bank. This Project is to build a micro-services architecture to deliver a next-generation customer experience. ECS contains different microservices to support discover student loans and to provide hardship features to their customers.

Technologies: Spring Boot, Microservices, PCF, OCP, CLOUD, DB2

Role : Offshore Developer

Methodology: Agile

Responsibilities:

- Analyzed business requirements and implemented optimal solutions aligned with best practices and system architecture.
- Migrated Spring Boot applications from Pivotal Cloud Foundry (PCF) to OpenShift Container Platform (OCP), ensuring seamless deployment and scalability.
- Upgraded Spring Boot applications and adopted Trident 2.2 pipeline in Jenkins for streamlined CI/CD automation.
- Configured Trident deployment settings for both PCF and OCP environments to support consistent and secure application delivery.
- Integrated JaCoCo plugin into Spring Boot applications to measure and improve code coverage.
- Implemented OpenAPI/Swagger documentation for REST endpoints to enhance API discoverability and developer collaboration.
- Resolved Nexus IQ vulnerabilities and pipeline issues in Jenkins to ensure secure and stable builds.
- Addressed code quality issues identified by SonarQube, improving maintainability and reducing technical debt.
- Secured REST endpoints using JWT-based authentication, ensuring robust access control and data protection.
- Developed inter-service communication using Feign Clients and RestTemplate for synchronous microservice integration.
- Built and maintained the DAO layer for data access using IBM DB2, ensuring efficient and reliable database interactions.
- Wrote comprehensive unit tests using JUnit and Mockito, and acceptance tests using Cucumber to validate business logic and workflows.
- Performed API testing using Postman to ensure functional accuracy and contract compliance.

4. Project: Carnival Cruise Line - Carnival Corporation (Jan 2019 – Mar 2020)

Description: This is a spring-boot microservices based application split across different modules, which serves as the back end for the different reactive UI's. The GUI app is used by the crew/staff on a cruise ship. This Project is to build a micro-services architecture with Crew Compass, xiLodging and xiIdentity to deliver a next-generation guest experience for both land and sea assets. xiLodging touches Guest Booking, Guest Journey and Ship Itinerary which are foundational to the OCEAN Experience Platform. xiLodging also supports Accommodations, Housekeeping, Disembarkation, Room Requests, Incident Management, and Lost & Found functionality.

Technologies: Spring Boot, Microservices, Spring Data, Couchbase

Role : Offshore Developer

Methodology: Agile

Responsibilities:

- Analyzed business requirements and implemented optimal solutions using best practices in microservices architecture.
- Developed the DAO layer using Spring Data Couchbase Repository, enabling efficient NoSQL data access and persistence.
- Produced and consumed JSON messages via Apache Kafka, supporting real-time, event-driven communication between services.
- Participated in Spring Boot, Kafka, and Couchbase version upgrades to enhance performance, security, and compatibility.
- Secured REST endpoints using OAuth2, ensuring robust authentication and authorization across distributed services.
- Built inter-service communication using Feign Clients and Rest Template for synchronous microservice integration.
- Implemented Swagger/Open API documentation for REST endpoints to improve API usability and developer collaboration.
- Created Ansible playbooks tailored to specific environments for consistent and automated configuration management.
- I wrote comprehensive unit tests using JUnit and Mockito to ensure code quality and functional correctness.
- Performed unit and integration testing using Postman to validate REST APIs and ensure functional accuracy.
- Prepared detailed release notes after each sprint, documenting new features, bug fixes, and deployment instructions.
- Created and managed change requests for production deployments, ensuring compliance with release and changing management processes.

5. Project: HAP-Digital - Health Alliance Plan (Mar 2018 – Jan 2019)

Description: This project contains set of e-commerce applications to interact with HAP through digital channel to provide responsive screens, accessed by Members, Providers/Vendors, Employer Groups, Agents, Payers and Prospect/Guest after enrollment for varying needs along with Single Sign On to third party websites.

Technologies: Spring Boot, Spring MVC, Thyme Leaf, Spring Data, Html, CSS, Java Script, Bootstrap, AJAX

Role : Offshore Developer

Methodology: Agile

Responsibilities:

- Analyzed functional requirements and implemented optimal solutions using modern web and backend technologies.
- Developed responsive and dynamic UI components using Thymeleaf, HTML, CSS, and Bootstrap to enhance user experience.
- Implemented AJAX calls for asynchronous data fetching and seamless user interactions without full page reloads.
- Built the DAO layer using Spring Data JPA for efficient and scalable database operations.
- Developed the controller layer using Spring MVC, handling HTTP requests and coordinating between the UI and backend services.

6. **Project:** POS-Indirect – Verizon Data Services Pvt. Ltd (Sep 2017 – Mar 2018)

Description: Verizon is American telecommunication company which offers wireless products and services. It is completely owned subsidiary of Verizon Communications. Verizon is second largest wireless telecommunications provider in the United States. Verizon offers mobile phone services through variety of devices.

Technologies: Spring Boot, Spring Rest, Spring Data, Spring Reactive

Role : Offshore Developer

Methodology: Agile

Responsibilities:

-
- Communicate with the team to understand requirements, analyze requirements and implementing best solution.
 - Used Jira as the bug tracking system to track and maintain the history of bugs/issues on everyday basis
 - Interacting with Ui team, retail teams for fixing issues
 - Performed the system testing, regression testing for complete UI after fixing the issues which are reported by team.

7. **Project:** Telenor-Norway (Defect Tracker) (Jan 2017 – Sep 2017)

Description: The Application is used for handling bugs effectively in software development and updating issues in modules and applications to testing team and project leaders, programmers through email notifications, user maintenance, user access control and report generation. This system is a web application which works as intranet application. Customer resource management is integrated with this application, which makes this software more efficient in terms of time management and reducing manual work.

Technologies: Angular, Node JS.

Role : Offshore Developer

Methodology: Agile

Responsibilities:

- Developed TypeScript component, service, and interceptor classes to build modular and maintainable Angular applications.
- Created dynamic and responsive view components using HTML and Angular Material modules for enhanced UI/UX.
