SUMMARY

Experienced software and systems engineer with hands-on experience in analysis, design, development, testing, and deployment of various applications. Skilled, self-motivated, and supportive working in team-based agile environments who enjoys learning, teaching, and implementing new technologies.

EXPERIENCE

AVALARA

Remote

Salesforce DevOps Release Engineer

2022 - Present

- Implemented monitoring platforms in AWS ECS using Terraform to monitor platform level Salesforce events, Quote to Cash (Q2C) endpoints, Boomi APIs, and Quality Assurance (QA) testing results. ECS targets were scraped by Prometheus and then visualized in Grafana for real-time alerting (OpsGenie).
- Transformed a custom GitLab repository for Salesforce metadata across various domains into a fully automated pipeline that validates, destroys, and deploys metadata, while enforcing quality code (SonarQube) to deploy faster and efficiently. Deployment times decreased on average 15% and deployment success rates increased 25% due to the quality gates implemented.
- On-call support for Salesforce platform issues. Responded to and escalated critical issues by developing an escalation framework.
- Reduced Salesforce data storage by over 20% by implementing a batch framework to delete records like email messages and tasks.
- Prepared weekly release notes, deployment guides, and troubleshooting material for the Salesforce and Boomi platforms. Release notes included sorting items by new features, enhancements, or bug fixes.
- Worked with multiple development teams to ensure release assets were deployed at the end of sprint cycles.

NAVAL SURFACE WARFARE CENTER

Philadelphia, PA

Software Engineering Lead

2020-2022

- Maintained a group of GitLab repositories for image configuration management, including versioning, merging, and automated builds.
- Oversaw hundreds of critical software engineering efforts to implement new features and bug fixes such as Windows 10 Physical Throttle and Integrated Bridge System Technical Refresh.
- Developed a configuration matrix to track software releases for steering control and voyage management systems on all DDG-51 class destroyers.
- Lead a small agile team to support software efforts for all DDG-51 class destroyers.
- Facilitated peer reviews with senior management to review new software releases prior to delivery and installation.
- Introduced best practices with configuration management and version control with images delivered for steering and navigation systems.

Systems Engineer

2018 - 2020

- Troubleshooted hardware, software, and networking issues on steering, thrust, and navigation systems.
- Developed test plans, ship operation verification tests, test procedures, and administrator guides.
- Verified proper installation of steering and navigation consoles throughout the ship.
- Recreated shipboard issues in the land based test site to identify deficiencies and develop solutions to be delivered to the ship.
- Contributed to the migration of legacy systems from Windows 2000/XP to Windows 10.

PROJECTS

SALESFORCE DECOMPOSER (TYPESCRIPT)

- Breaks down large Salesforce metadata files (XML) into smaller files for enhanced configuration management and reassembles them for deployments.
- Solves issues with large metadata file management, expecting code reviews and making deployments safer.
- GitHub: <https://github.com/mcarvin8/sf-decomposer>

APEX CODE COVERAGE TRANSFORMER (TYPESCRIPT)

- Transforms coverage reports in JSON format to multiple formats (Sonar, JaCoCo, LCOV, Cobertura, Clover) accepted by external tools (GitHub, GitLab, Azure, BitBucket, etc.).
- Fixes several issues with the code coverage files created by Salesforce.
- Crucial to implementing quality code gates as a requirement for Salesforce Apex deployments.
- GitHub: <https://github.com/mcarvin8/apex-code-coverage-transformer>

SALESFORCE MONITORING PLATFORM (TERRAFORM)

- An AWS ECS which monitors your Salesforce org's API usage, license usage, incidents, Apex usage, etc.
- Implemented a Docker image that runs customized Python scripts for platform and domain specific events.
- Service creates Prometheus targets scraped by a separate ECS that is visualized in a Grafana dashboard. Dashboard alerts are configured in OpsGenie.

EDUCATION

ROWAN UNIVERSITY

Bachelor of Science, Electrical and Computer Engineering

Glassboro, NJ

2014-2018

- Certificate: Certificate of Undergraduate Studies in Combat Systems Engineering

SKILLS

Languages: JavaScript, TypeScript, Python, PowerShell, Bash

Operating Systems: Windows, Linux

Tools: Grafana, Prometheus, Microsoft Office, Visual Studio, Git, Jira, Confluence, Mocha, AWS, Docker, Mocha

CI/CD: GitLab, GitHub
