

Jared Everist *Senior Full Stack Developer*

✉ jared8848.top@gmail.com 📍 Bristow, VA ☎ +1 (201) 502-0300 🌐 Jared Everist

👤 Summary

Skillful Full-stack developer with 10 years of experience building and maintaining complex web and microservice applications using Python backend, React, and AWS/Azure. Experienced in AI-driven solutions for healthcare applications, along with building scalable and fault-tolerant systems. Works effectively in agile teams, mentoring junior developers, reviewing code, and coordinating with cross-functional teams to keep projects aligned and reliable.

🧠 Skills

Programming Language

Python, TypeScript, JavaScript, C#, Java, PHP, HTML, CSS

Cloud & DevOps

AWS, Azure, GCP, Docker, Kubernetes, Terraform

Database & Caching

MySQL, PostgreSQL, SQLite, MSSQL, Oracle, T-SQL, MongoDB, Cloud DBs, Redis

Frameworks & Libraries

Django, Flask, FastAPI, Node, js, .NET, Laravel, React, Angular, Tensorflow/PyTorch, Panda, Numpy, pytest, unittest, selenium

API Communication & Architecture

RestAPI, GraphQL, Pipedream, Websocket, WebRTC, Webhook, Webhook, Microservices

Others

Test-driven Development, Event-driven Architecture, AI/ML, Data Solutions, Agile Scrum, Leadership

📁 Professional Experience

Boston Consulting Group, *Senior Full Stack Developer*

08/2023 – 07/2025 | Boston, United States

- Played a huge role in migration of **Warby Parker's** ecommerce project from legacy monolithic arcs to cloud-native and microservice-based arcs using **Python/Django, Node.js, React/Next/Typescript** and **AWS**.
- Built backend apis using **Django Rest Framework**, establishing communication between microservices with **Apache Kafka**.
- Achieved optimization of **api integration** by utilizing **GraphQL(Graphene, Apollo, query, mutation)** for some sensitive functionalities such as product catalogs and user profiles.
- Modernized **Django Template** UI to **SPA-based** one using **React 18/Next.js/TypeScript** and **Tailwind**, and employed performance optimization methods such as **code splitting** and **lazy loading** to reduce initial load time. This remarkably reduced latency, enhanced **SEO** and made the frontend more responsive and elegant.
- Used **SQL/NoSQL** databases (**PostgreSQL, MongoDB**) and in-memory data stores like **Redis** to build a database management system that handles high-volume transactions, optimizing storage and query performance with query optimization, indexing strategies, and stored procedures to improve response times in the PostgreSQL database.
- Extensively utilized **AWS** services such as **Lambda** for serverless computing, **S3** for product image storage, **CloudFront** for content delivery, and **EC2** for server hosting, optimizing performance and reducing infrastructure management overhead.
- Set up secure authorization and authentication for the platform using **AWS IAM** for role-based access control, **OAuth2** for user authentication, and **JWT** for session management, maintaining strong security protocols throughout the application.
- Integrated **PCI-DSS** compliant payment gateways like **Stripe, PayPal**, and **Apple Pay** to enable transaction-level security and compliance, safeguarding sensitive customer data during payments.
- Migrated the shipping api from **soap-based** one to **rest-based**, using **Easyship API** blending with **Pipedream** for triggering **webhooks** and **Websockets**(using **Django Channels**) so as to implement automatic shipping processes such as **rate-calculation, label printing** and **real-time tracking**.
- Built a **chatbot** using libraries like **LangChain** and **GPT** to provide personalized recommendations, enhance user interaction, and automate responses based on user input and preferences.

- Implemented comprehensive testing for the backend using **unittest** for unit tests, **pytest** for integration tests, and **Selenium** for end-to-end testing, to maintain the reliability and functionality of the application at all levels.
- Developed **CI/CD pipelines** using **Github actions** to automate testing and deployment of applications in **Docker** containers, managed scalable orchestration with **Kubernetes**, and used **Terraform** for Infrastructure as Code (**IaC**) to maintain smooth deployments and efficient infrastructure.
- Implemented **SonarQube** for static code analysis vulnerabilities and best practices, and code security and maintainability.
- Mentored junior developers, conducted insightful code reviews, and actively contributed to continuous improvement initiatives.
- Worked within **Agile Scrum** teams while mentoring junior developers, conducting code reviews and being able to help improve team productivity and development.

Tech Stacks: Python, Django, React, AWS, PostgreSQL, MongoDB, RestAPI, GraphQL, Kafka, Docker, Pipedream, WebSockets

Nomi Health, Python Developer

02/2020 – 06/2023 | Orem, United States

- Contributed to development of AI-driven startup healthcare providers by building Python Flask and FastAPI microservices for AI-driven data solutions and ML models to support making clinical decisions.
- Built optimized and lightweight apis with Flask and FastAPI keeping sync with frontend developers, and used RabbitMQ for event-driven communication between microservices
- Assisted data engineer to establish real-time ETL pipelines by building python apps which transform clinical csv/parquet files to required format following HIPAA and FHIR regulations, and leveraging Azure services like Data Factory, Databricks and Synapse for data handling.
- Managed SQL databases to support data engineer by writing complex queries, optimizing performance, and assisting with data extraction, transformation, and loading processes for better data accessibility and analysis.
- Employed some traditional machine-learning methods of classification and clustering to organize complex clinical data.
- Worked on building and organizing CT scan datasets for training deep learning models to detect COVID-19, handling tasks like cleaning, labeling, normalizing, and augmenting images to make the system more reliable and accurate.
- Assisted AI engineers to build a RAG pipeline on clinical databases, combining vector embeddings for semantic search with generative AI models, using tools like FAISS, Elasticsearch, and LangChain to provide context-aware answers from large healthcare datasets.
- Managed FastAPI microservices in Docker containers and deployed them on Azure Kubernetes Service, building a fault-tolerant system that could scale, handle updates, and keep healthcare applications running reliably.
- Worked alongside .NET full stack engineers and the DevOps team to coordinate development, deployments, and infrastructure, keeping projects aligned and systems reliable while solving technical challenges together.

Tech Stacks: Python/FastAPI/Flask, React, Angular, ASP.NET, PostgreSQL, MongoDB, Azure, RabbitMQ, ML, Data Pipeline

Anaplan, Software Developer

07/2015 – 12/2019 | Miami, United States

- Built web applications for Telecom platforms using Python, Flask, Django, Node.js, TypeScript, and React.
- Managed databases with MySQL and PostgreSQL, working on data storage, queries, and retrieval.
- Integrated third-party APIs such as Twilio for messaging and Stripe for payment processing.
- Created a customer engagement platform with HTML, CSS, JavaScript, and Bootstrap, focusing on responsive and user-friendly interfaces.
- Developed a business management system using PHP, Laravel, and MySQL to streamline operational workflows.
- Worked with Object-Oriented Programming, networking concepts, and cloud computing in practical projects.
- Used Git for version control while participating in team discussions, demos, and agile development activities.

For the first year, worked as a summer employee and after graduation, hired as a junior developer and gradually promoted to mid-level.

Education

Bachelor 's Degree on Computer Science,
University of Cambridge

09/2012 – 06/2016
Cambridge, United Kingdom
