

Software Engineer

SUMMARY:

SKILLS:

Software Development Methodologies: Agile (Scrum), Waterfall, SDLC, DevSecOps Implementation

Amrita Vishwa Vidyapeetham, Kerala, India

DXC Technology, USA | June 2024 – Current | Software Engineer

- Architected cloud-native microservices using AWS EC2, AWS Lambda, and Amazon S3, implementing auto-scaling and load balancing to improve system resiliency by 30% during peak workloads.
- Refactored legacy monolithic applications into modular Spring Boot services, reducing deployment cycle time by 35% and enabling faster, independent feature rollouts.
- Automated end-to-end deployment pipelines with Jenkins, Docker, and Kubernetes, eliminating manual deployment steps and increasing release frequency by 50%.
- Optimized database performance by fine-tuning PostgreSQL and MongoDB queries and introducing Redis-based caching, reducing API latency by 25% and enhancing data throughput.
- Enforced code quality standards through SonarQube gates and expanded JUnit test coverage beyond 90% for new modules, significantly improving maintainability and reducing production defects.
- Facilitated Agile ceremonies including sprint planning, retrospectives, and daily stand-ups, boosting sprint velocity and ensuring consistent on-time delivery of key features.

Virtual Infotech Solutions, India | January 2022 – December 2022 | Software Engineer

- Engineered a scalable Internal Developer Platform using Terraform, Kubernetes, GitHub Actions, and Jenkins to automate environment provisioning and streamline deployments, reducing setup time for new services by approximately 60%.
- Implemented advanced DevSecOps practices by integrating Open Policy Agent, Snyk, and HashiCorp Vault into CI/CD workflows, enhancing security compliance and eliminating hard-coded credentials in deployment pipelines.
- Developed an AI-driven deployment assistant using Python and the OpenAI GPT-3 API to analyze logs and recommend configuration optimizations, reducing deployment errors and improving developer productivity.
- Deployed comprehensive observability solutions using Prometheus, Grafana, and the ELK Stack to establish real-time performance dashboards and automated alerting, cutting incident response time and improving system reliability.

Neon IT Systems, India | June 2020 – December 2021 | Associate Software Engineer

- Developed enterprise-grade full-stack applications using Java 8, Spring MVC, Hibernate, React.js, and Bootstrap, delivering high-performance solutions for 10+ clients and reducing support tickets by 15%.
- Designed and optimized MySQL and Oracle database schemas with stored procedures, triggers, and automation scripts, streamlining 40% of manual data workflows.
- Enhanced user interface responsiveness through React.js optimization, lazy loading, and asset minification, reducing average page load time by 30% and improving user satisfaction.
- Containerized legacy applications into Spring Boot services and reconfigured infrastructure for better scalability, reducing operational costs by 25% and simplifying maintenance.
- Integrated third-party services through RESTful APIs secured with OAuth 2.0, automating key business operations and removing redundant manual tasks.
- Delivered complete software solutions across all SDLC phases, including requirements analysis, system design, development, deployment, and post-production support, consistently meeting release timelines.

PROJECTS:

AI-Powered Agentic Automation Platform

- Built an Agentic AI system capable of autonomously executing tasks such as report generation and email triage.
- Implemented a React.js dashboard to visualize agent interactions and execution flow, deployed on Azure App Service via Docker and CI/CD.
- Designed multi-agent collaboration using LangChain and integrated FastAPI for intelligent context retrieval.
- Integrated OpenAI GPT models for natural-language understanding and adaptive decision making.
- Achieved 60% task automation efficiency and reduced manual operational workload by 40%.
