

Nishita G

Dallas, TX | +1 - (940)-448-0585 | nishita.g5@outlook.com

PROFESSIONAL SUMMARY

Software Engineer with over 10 years of experience designing and delivering secure, scalable, and high-performance applications across cloud, backend, and frontend environments. Specialized in full-stack development using **Java (8/17)**, **Spring Boot**, **Python**, **Node.js**, **React.js**, and **Angular**, with strong expertise in building microservices, RESTful and GraphQL APIs, and enterprise-grade authentication using **OAuth 2.0**, **SAML**, and **Azure AD**. Demonstrated ability to implement clean architecture, design patterns, and reactive programming principles, supported by robust testing practices and static code analysis to ensure quality and maintainability. Extensive experience in deploying cloud-native solutions using **AWS** and **Azure**, leveraging services such as **EKS**, **AKS**, **Azure SQL**, **Cosmos DB**, **S3**, **Cognito**, and **Secrets Manager**. Proficient in CI/CD automation, containerization, and infrastructure as code using **GitHub Actions**, **Docker**, **Kubernetes**, **Terraform**, and **ARM Templates**. Integrated **AI/ML features** including **Prompt Engineering**, **LLMs**, and **RAG pipelines** to enhance automation and decision-making in compliance and workforce intelligence platforms. Strong focus on observability, DevSecOps, and Agile delivery for building resilient, production-grade systems.

SKILLS

- **Languages & Frameworks:** Java (8), Python, Node.js, Spring Boot, Redux, JSP, jQuery
- **Backend & Microservices:** RESTful APIs, OpenAPI/Swagger, OAuth 2.0, SAML, Azure AD, Kafka, RabbitMQ, Redis
- **Frontend Development:** React.js, Redux, Angular, Context API, Hooks, Formik, Yup, Chart.js, Bootstrap
- **Cloud & DevOps:**
 - **Microsoft Azure:** Azure Kubernetes Service (AKS), Azure SQL, Cosmos DB,, Azure Monitor, Log Analytics, Azure Key Vault, Azure Active Directory (Azure AD / Entra ID), ARM Templates, Azure Boards
 - **AWS:** Amazon EC2, Amazon EKS, Amazon ALB, Amazon Cognito, AWS Secrets Manager, Amazon CloudWatch, Amazon QuickSight, Amazon RDS, AWS Glue, Amazon S3, IAM Roles

CERTIFICATIONS

- AWS Certified Solutions Architect - Professional
- Azure AI Engineer Associate
- Oracle Certified Associate (OCA), JAVA SE 8 Programmer

EXPERIENCE

Senior Software Engineer

Paycom

Aug 2022 - Present

Oklahoma City, OK

Overview: Designed and developed AI-driven HR platforms, including an "I Want" self-service solution that enabled employees and managers to initiate requests (e.g., bonus adjustments, team transfers, benefits updates) via natural language, and a compliance intelligence platform that identified regulatory risks tied to employee transitions, compensation, and evolving job roles. Leveraged LLMs, Agentic AI, and RAG pipelines to understand intent, fetch contextual policies, and automate workflows, while delivering personalized dashboards that dynamically adapted to user roles and policy changes. These innovations streamlined HR service delivery, reduced ticket volume, accelerated compliance reviews, and improved organizational policy adherence across multiple states and departments.

- Leveraged **Java 17** features such as **sealed classes**, **records**, and **pattern matching** to build a dynamic rules engine that surfaced compliance risks by adapting to real-time policy changes.
- Developed **RESTful microservices** for bonus logic, eligibility rules, and routing workflows using **Spring Boot**, ensuring scalable and secure backend operations.
- Defined **OpenAPI specifications** for compensation APIs using **Swagger**, enhancing integration with external HRIS systems like Workday and SAP, speeding up development.

- Applied **Resilience4j** to incorporate **circuit breakers** and retries, improving robustness during failures from downstream systems and HR data providers.
- Adopted **reactive programming principles** using **Spring WebFlux** to handle high-concurrency workflows, enabling non-blocking I/O and reducing request latency by 35% under peak load conditions.
- Built secure **APIs**, integrating **Amazon Cognito** with **OAuth2.0 (JWT-based authentication)** to enforce enterprise-grade, role-based access control across compensation services.
- Led **Python fastAPI** microservices design to manage performance reviews and employee data, supporting modular compensation workflows.
- Used **AWS Secrets Manager** with automatic rotation and **IAM** role-based access to secure secrets across **Spring Boot** and **fastAPI** services, ensuring enterprise-grade encryption, reducing risk exposure, and maintaining compliance with internal security policies.
- Designed a feedback classification engine using **Python**, enabling automated tagging of employee sentiments and themes for actionable HR insights.
- Developed dynamic and responsive front-end components using **Angular 12+**, enabling HR users to configure bonus logic, initiate performance reviews, and track approval workflows via modular UI widgets.
- Used **Angular lifecycle hooks** like `ngOnInit` and `ngAfterViewInit` to manage data flow and DOM logic, enhancing UI stability and responsiveness.
- Applied **lazy loading** and **module-based bundling** to optimize load times and improve performance of large-scale compensation dashboards.
- Connected frontend Angular modules with backend **Spring Boot** and **fastAPI** microservices using **Angular HttpClient**, enabling seamless data exchange for bonus rules, review feedback, and employee records through secured, observable-based API integrations.
- Built **GraphQL APIs** using **Apollo Server** and **TypeScript** to expose compensation logic and feedback data, improving query efficiency and reducing frontend overfetching.
- Followed **Test-Driven Development (TDD)** practices and conducted unit testing using **JUnit**, **PyTest**, and **Jasmine**, significantly reducing bugs during feature rollouts and ensuring improved production stability of review portals.
- Enabled **Redis** as a centralized cache layer to store user session tokens and in-progress review data, improving API response times, reducing load on backend services.
- Integrated **Kafka** for decoupling services during high-traffic events like review cycles, ensuring real-time message processing.
- Configured and administered **Apache Kafka** clusters including topic creation, ACLs, partition tuning, and broker management to support high-throughput messaging workflows across microservices, improving fault tolerance and system observability.
- Applied **Prompt Engineering** techniques to design structured queries that guided **LLMs** in summarizing workforce review justifications, manager feedback, and role-change narratives with consistency and precision.
- Implemented **Retrieval-Augmented Generation (RAG)** by connecting LLMs to a vector store of past compliance incidents and policy documents, improving the contextual accuracy of generated summaries.
- Integrated these **Generative AI (GenAI)** workflows into the compliance dashboard to automate classification of high-risk feedback themes, reducing manual HR effort by over 60% and accelerating regulatory readiness checks.
- Built interactive dashboards in **Amazon QuickSight** to visualize compensation trends, feedback sentiment scores, and policy compliance metrics, enabling HR teams and executives to monitor workforce insights in real time and make data-driven decisions.
- Maintained version control and code review discipline using **GitHub**, ensuring quality via PR workflows and branching strategies.
- Implemented **CI/CD pipelines** using **GitHub Actions**, reducing deployment time and manual effort by 60%, accelerating the rollout of new HR features.
- Containerized **microservices** using **Docker** and deployed via **Amazon Elastic Kubernetes Service (EKS)**, enabling scalable, fault-tolerant infrastructure for high availability during review cycles.
- Provisioned **Terraform-based Infrastructure as Code (IaC)** to manage AWS resources including EKS clusters across multiple environments like DEV, INT and UAT, ensuring consistent, scalable, and auditable infrastructure deployments.
- Performed **blue-green deployments** on **EKS**, using weighted traffic shifting in **AWS Application Load Balancer (ALB)**, allowing seamless, zero-downtime rollouts of critical services.
- Introduced **GitOps** workflows using **GitHub**, ensuring traceable and reliable deployments of compensation components with minimal rollback incidents.

- Created dashboards using **Grafana** and **Prometheus** for visualizing API throughput and error rates.
- Monitored applications using **Amazon CloudWatch** dashboards and **alarms**, proactively identifying bottlenecks and reducing mean time to recovery for user-facing services.
- Integrated **PagerDuty** with **CloudWatch alarms**, automating incident escalations for failures in high-risk workflows, which reduced response time and improved SLA adherence.
- Integrated static code analysis using **SonarQube**, ensuring adherence to secure coding practices and reducing vulnerabilities before merging code to main branches.
- Led **cross-functional collaboration** across Engineering, Product, and QA to deliver high-impact HRTech platforms
- Led **Agile** ceremonies including sprint planning, daily standups, and retrospectives, and used **Jira** to manage backlogs, track story progress, and monitor team velocity.
- Documented all **API contracts** and deployment processes in **Confluence**, improving onboarding efficiency and operational consistency.

Tech stack: Java, Springboot, REST API, Swagger, MongoDB, Express.js, python, fastAPI, Angular, Python, mricroservices, docker, kubernetes, Jest, Redis, Kafka, gitHub, SonarQube, CI/CD, Databricks, RAG models, ETL, Agile, AWS, Jira, GraphQL

Senior Software Engineer

Jan 2020 - Jul 2022

GAF

Dallas, TX

Overview: Modernized the contractor experience by delivering a unified platform consolidating project tracking, billing, and documentation workflows. Replaced fragmented tools with a centralized system to improve operational visibility, decision-making, and efficiency across job sites. Leveraged past project patterns to introduce early warning indicators that highlighted potential delays, enabling proactive action before disruptions occurred. Designed the platform for sustained high performance during peak construction periods, resulting in improved project outcomes, reduced rework, and increased contractor satisfaction.

- Developed **RESTful microservices** using **Spring Boot** and **Node.js** to unify project tracking, billing, and documentation modules, streamlining contractor operations across all job sites.
- Stored structured relational data such as contractor profiles, job schedules, billing transactions, and audit logs in **Azure SQL**, ensuring ACID compliance and support for ad-hoc reporting.
- Built secure authentication and role-based access control using **Azure Active Directory (Entra ID)** integrated with **OAuth 2.0**, ensuring permissioned access to sensitive job data.
- Implemented **Java 8** constructs (Lambdas, Streams, CompletableFuture) in business services to simplify model definitions and reduce boilerplate in backend services.
- Used **Resilience4j** for implementing **circuit breakers** and retries, improving system resilience during third-party API failures.
- Used **Azure Key Vault** to securely manage API keys, credentials, and tokens, integrating with Spring Boot services via managed identities.
- Created responsive dashboards in **React.js** and managed state with **Redux**, enabling real-time visibility into job milestones, billing progress, and documentation flow.
- Designed modular UI components using **React Hooks** to support configurable forms and widgets for on-site task tracking.
- Used **Kafka** to asynchronously track billing submissions and project updates, ensuring non-blocking workflows and high throughput during peak construction seasons.
- Implemented **Redis** caching for frequent contractor queries, improving dashboard performance and reducing backend load.
- Integrated **Azure Blob Storage** with document upload workflows to store high-resolution site plans, signed contracts, and audit trails, enabling secure, scalable, and searchable storage.
- Used a pre-trained **logistic regression model (scikit-learn)** to classify project updates as on-track, at-risk, or delayed, enabling site supervisors to intervene earlier and reduce timeline overruns.
- Applied a pre-trained **random forest classifier** to flag billing entries and document logs with inconsistencies based on historical project data, improving audit accuracy and reducing financial errors.
- Developed **Python services** to process incoming updates from contractor logs, integrated the model to return predictions via an internal **Flask API**, and validated results using labeled historical cases, achieving 85% classification accuracy.
- Stored unstructured and semi-structured data including site photos, scanned documents, and real-time logs in **Cosmos DB**, enabling schema-flexibility and faster retrieval for document preview and search features.

- Created custom dashboards using **Chart.js** embedded in **React**, enabling field managers to visualize billing trends, site progress, and risk flags.
- Packaged all microservices using **Docker** and deployed them to **Azure Kubernetes Service (AKS)** with autoscaling, ensuring performance stability during peak usage.
- Used **Helm charts** for Kubernetes configurations, enabling reusable, version-controlled deployments across development and staging environments.
- Built **CI/CD pipelines** using **GitHub Actions**, for automatic testing and deployment of the model API, with rollback policies for prediction logic changes.
- Implemented **reactive pipelines** using **RxJava** and **CompletableFuture** in Spring Boot services to handle streaming contractor updates and billing submissions, improving throughput and reducing latency under concurrent user loads.
- Monitored service health using **Azure Monitor** and **Log Analytics**, setting up action groups for SLA breaches, reducing incident response time.
- Scheduled backend **batch jobs** using **AutoSys** to trigger nightly billing reconciliation, document archival, and model prediction pipelines, ensuring consistent backend operations without manual intervention.
- Conducted sprint ceremonies and tracked burn-down metrics using **Azure Boards**, improving delivery predictability and stakeholder communication in an **Agile** environment.
- Coordinated closely with **data engineers, DevOps, field operations** to refine contractor KPIs and streamline data synchronization across real-time and batch ETL flows.
- Conducted **code reviews** and enforced static analysis rules for better code health and reduced technical debt.

Tech stack: Java, Spring Boot, Microservices, REST API, Swagger, MongoDB, Express.js, Node.js, React.js, JavaScript, Python, Azure, microservices, docker, Kubernetes, Flask API, Jest, Junit, Redis, Kafka, GitHub, CI/CD, Azure boards, Agile

Software Engineer

Dec 2017 - Jan 2020

OpenText

Hyderabad, IN

Overview: Led the migration of OpenText's monolithic ECM architecture to microservices, modernizing backend systems, improving UI responsiveness, and enhancing observability. The transformation resulted in faster feature development, better fault isolation, and a modular, maintainable codebase.

- Led the migration of **legacy Spring MVC** applications from on-premises **WebLogic servers** to containerized **Spring Boot** microservices on **AWS EKS**, improving scalability, reducing release time, and enabling CI/CD automation.
- Managed backend project builds and dependency resolution using **Apache Maven**, ensuring consistent compilation, versioning, and reproducible builds across **Spring Boot** microservices during monolith-to-microservices migration.
- Developed **RESTful APIs** using **Spring Boot**, enabling independent deployment of features and better system scalability.
- Authored API specifications using **Swagger**, enhancing developer onboarding and ensuring seamless internal API consumption.
- Developed admin dashboards using **Angular 6** to manage content templates and workflow settings, enhancing content configurability.
- Used **Node.js** scripts and managed dependencies with **npm** to automate UI asset bundling and post-build validations, streamlining the frontend release process and reducing build errors.
- Integrated **Jest** and **JUnit** test suites into the cloud-based CI/CD pipeline using GitHub Actions, enabling automated unit and integration testing across frontend and backend services to ensure code quality and reduce production issues.
- Tuned **PostgreSQL** queries and created SQL triggers to support business rules execution, enhancing query performance.
- Implemented unit tests using **Jasmine** for Angular components and services, increasing test coverage and ensuring reliability of UI functionalities before production releases.
- Integrated **RabbitMQ** into Spring Boot services for async communication during document archival, reducing processing delays and decoupling backend workflows.
- Integrated with enterprise **SSO systems** using **OAuth 2.0** and **SAML protocols**, enabling **token-based authentication** and **role-based access control**, which reduced login friction and significantly lowered support requests related to access issues.
- Contributed to the migration of legacy applications from on-premises servers to the **AWS cloud** by supporting containerization with **Docker**, infrastructure provisioning with **Terraform**, and deployment automation via Jenkins.
- Developed automation scripts in **Python** for batch ingestion of documents, reducing manual effort by 80% and increasing

throughput.

- Built interactive dashboards using **Plotly Dash** in Python to visualize service health and system load, supporting real-time operational decisions.
- Established CI/CD workflows in **Jenkins**, automating testing and deployment for faster feedback cycles.
- Implemented monitoring and alerting using **AWS CloudWatch**, increasing operational visibility and reducing resolution time.
- Enabled centralized logging with **Log4j**, setting alerts for error patterns to enhance observability.
- Resolved critical production issues via on-call rotations, ensuring the **system uptime** and **SLA compliance**.
- Attended **Agile** standups and tracked sprint velocity in Jira to ensure progress transparency.
- Delivered product demos to internal stakeholders showcasing API enhancements and digital signature workflows.
- Provided support during critical deployments and production hotfixes, ensuring minimal downtime.

Tech stack: Java, Spring boot, REST API, Swagger, MongoDB, Express.js, Node.js, Angular, Python, microservices, docker, Kubernetes, AWS, Jest, Junit, Redis, Kafka, Grafana, Prometheus, data visualization, GitHub, CI/CD, Databricks, RAG models, ETL, Agile

Software Engineer

May 2015 - Dec 2017

Netcore

Hyderabad, IN

Overview: Contributed to building a real-time personalized marketing system to enhance user engagement and campaign performance. The system analyzed user behavior and adapted content delivery based on profile segmentation and feedback, offering a customized digital experience.

- Developed core backend logic for audience segmentation and campaign workflow automation using **Java** with **Spring MVC** and **Servlets**, adhering to object-oriented design principles.
- Designed and implemented **RESTful APIs** to manage user profiles, behavioral events, and campaign triggers, facilitating communication between the backend and frontend systems.
- Created cron-based batch jobs in Java to automate audience list generation and campaign scheduling, reducing manual intervention and improving campaign efficiency.
- Integrated **JSP**, **HTML**, **CSS** and **jQuery** on the frontend to display dynamic content in marketing dashboards used by campaign managers.
- Wrote complex SQL queries and stored procedures on **MySQL** and **Oracle DB** to enable audience filtering, behavior tracking, and real-time campaign decisioning.
- Used **JUnit** to create unit and integration tests, ensuring code quality and supporting TDD practices during feature development.
- Managed source control using **Git** (migrated from **SVN**) and supported peer reviews to maintain consistency across feature branches.
- Deployed applications to on-premises **Tomcat servers**, configuring deployment scripts using **Ant**.
- Applied object-oriented principles and implemented **design patterns** such as **Singleton** and **Strategy** to build maintainable modules for campaign logic, reinforcing core concepts learned during undergraduate coursework.
- Participated in **Agile** ceremonies including sprint planning, grooming, and retrospectives to align on feature delivery and business objectives.
- Monitored application health and **debugged production issues** using **Linux** commands to tail logs, analyze failures, and ensure high system reliability.

Tech stack: Java, spring MVC, REST API, Servlets, JUnit, Agile, MongoDB, OracleDB, JSP, HTML, CSS, JQuery, Tomcat, Ant, Linux
