

Total Experience: **12+ Years**

Pavan Bhavsar

.Net Professional (Full Stack)

SKILLS

Programming Languages: C#, .Net, JavaScript
Databases: SQL Server, SSIS, MongoDB
Tools (Software): Visual Studio, Visual Studio Code
Frameworks: .Net Core, MVC, Angular
UI Technologies: HTML, Angular, React, Bootstrap
Web/Enterprise Servers: IIS, PCF, Azure
IDEs: Visual Studio, Visual Studio Code
Reporting Tools: SSRS, Kendo
Build Tools: Jenkins, UDeploy, TeamCity, npm
Version Control: TFS, GitHub, Bitbucket
Design Patterns: MVC
Methodologies: Agile, Scrum, SDLC
Project Management Tools: Jira, Version one
Operating Systems: Windows, Mac OS

DOMAINS

Banking

ACHIEVEMENTS

Received various awards and recognitions like
Surpass and Spot Award at Synechron

TRAINING/ CERTIFICATIONS

Microsoft Certified: Azure Fundamentals (5EDUD6-
BAA5A3)

EDUCATION

Master of Science (Computer Science), Pune University

SYNOPSIS

- **12+** years of experience working as **.Net Full Stack** engineer in software design, analysis, development, testing and implementation of web and client server applications.
- Expertise in advanced technology frameworks such as **Angular, React, Microservices, .NET Core, MVC, Web API, ASP.NET**.
- Having experience in web services like **Web API, WCF and Windows services**.
- Strong exposure to Software Development Life Cycle (**SDLC**).
- Hands on experience in migrating legacy .net framework applications to latest version.
- Extensively handled **jQuery, JavaScript** and **TypeScript** based scripting.
- Good understanding of **Object-Oriented Programming (OOPS)**.
- Experience in responsive front-end development with **HTML5, CSS, Bootstrap** and **Telerik Kendo UI**.
- Having Experience in relational database development, for creating complex database data queries, writing **Constraints, Indexes, Views, Stored Procedures** in **SQL Server**.
- Expertise in **Dynamic SQL, Collections and Exception handling**.
- Proficient knowledge in **Entity Framework Core** Code First and Database First approaches with **ASP.NET**.
- Experience in working with NoSQL databases like **MongoDB**.
- Used defect tracking tools like **ALM, Jira, SonarQube, Version one** to manage user stories.
- Experience with version control Systems and deployment tools like **TFS, GitHub**.
- Experience working on build and deployment tools like **Jenkin, UCD, TeamCity**.
- Experience working on cloud platforms like **PCF, Azure**.
- Well, acquainted with **Agile/Scrum** methodologies.
- Utilized logging framework like **Splunk**.
- Having unit testing experience using **XUnit, NUnit framework**.
- Hands on experience in test automation of web-based applications using **Selenium, C#, SpecFlow** framework.
- Effective analytical and communication skills, with extensive experience in Client interactions.
- Self-directed to take challenges head on with minimal oversight.
- Initiative to learn and adapt new technologies/processes as well as transfer knowledge to others.

WORK EXPERIENCE

Assistant Manager Technology | Synechron (Jan'16 to Jan'25)

Jr. Software Engineer | Cloud9 Ebiz (Jan'12 to Jan'16)

Project: MOS (Merchant Onboarding System)

Client: Wells Fargo (USA)

Role: Application Developer

Duration: Jan'24 to Dec'24

Description: Wells Fargo has engaged Synechron for their Merchant Onboarding BTD redesign, project engagement, which is within the PVSI – Payments, Virtualization, Services, and Innovation teams. The BTD platform has been the core and critical platform for onboarding Merchants for community and wholesale banking. They contain many business rules, developed over time, and produce many critical outputs directed at various consumers within Wells Fargo in addition to the Merchants who are on board.

The technology employed by the current BTD platform, along with the long history of maintenance, has resulted in systems which are no longer agile and amenable to change. Customer value and experience are impacted due to the current monolithic architecture of the platform, which is heavily relying on Microsoft Dynamics & to remove dependency of legacy system they started with new initiate MOS proposal UI is utilized for entry of the data to understand the needs of merchant account associated with product and pricing and how they will process their transactions. This is the first step in the onboarding process of merchant processing.

The objective of the project is to:

- A new team has been formed, and resources are being added to form the technology expertise that is needed to redesign the platform.
- Employ design thinking to create UX for the UI screens.
- Create the .Net microservices using domain driven design and decomposition pattern, to enable loosely coupled service units.
- Build out .NET microservices based platform to achieve modularized, flexible, and scalable current onboarding application across the enterprise.
- Create responsive UI and Single Page Application using Angular. Employ Test driven development using Automated test framework in Jasmine and Karma.
- Creating REST APIs to enable the decoupled microservices to be exposed to the UI layer and exchange state information between each other.
- Implement application logging (transaction and exception) as per enterprise Standards, application classification, etc. Splunk and App Dynamics are used for application logging. Application teams must instrument application logging and configure the tools on runtime to leverage common PVSI implementation for log harvesting and reporting (DevOps workstream needs to address dependencies on capacity, log retention requirements, etc.)

Responsibilities:

- Involved in project life cycle phases including requirement study, design, development, deployment and testing.
- Involved in MongoDB schema creation and validation efforts.
- Design, develop and maintain database objects in SQL server.
- Developed and maintained web-based user interface with Angular and .Net Core Microservices.
- Written unit test cases using NUnit and automated test case scenarios using Selenium, C#, Specflow.
- Perform code review sessions to find code vulnerabilities, best practices and code standards applied, verify code consistency, security and reliability for application health.
- Involved in creating build and release pipelines (CI/CD) for deploying web application to the cloud (PCF).
- Maintain CI/CD configuration for Jenkin to build and auto trigger deployment to PCF lower environments.
- Maintain manifest file for deployment configurations and environment variables used in application.
- Branching activity to maintain release branches.
- Active participation in all agile ceremonies like backlog refinements, sprint planning, daily scrum and sprint review demos.
- Involved PROD deployment activity and root cause analysis of production defect and resolution.
- Driving code, design, and process optimization discussions withing team when required.
- Involved in documenting API specification and Game plan review for production release.
- Utilized splunk logging for application errors and warnings.
- Identify bottle necks, bugs and fix issues like High CPU usage, memory leaks, deadlocks and high response times to improve application performance and reliability.

Environment: Visual Studio 2022, MS SQL Server 2019, MongoDB, .Net Core Web API, Kafka, Jira, Jenkin, PCF, Git, UDeploy, Sonarqube, Checkmarks.

Project: ELEMNT (Enterprise Legal Entity and Management Tool)

Client: Wells Fargo (USA)

Role: Application Developer

Duration: Mar'22 to Dec'23.

Description: The Enterprise Legal Entity Management and Navigation Tool, or ELEMNT, is a next generation workflow management solution. Legal entity management is a governance system covering many facets of an organization core function of legal entity management is to compile and control the corporate records of a company, which has three workflows like Initiation, Change and Disposition information forms which will include legacy entity submission end to end approval workflow and automated data transfer to the legal entity system of records.

The objective of the project is to:

- Legal Entity office and other business stakeholders in the Law Department, Service Governance office, Risk Management, WFAS, Compliance, etc. will collect manage and distribute data required by the Legal Entity Policy and procedures to create, edit, or terminate legal entities.
- ELEMNT will be used to manage legal entity information changes happening in an organization as it owns partially/fully numerous businesses across the globe. This information will be kept in a system of records, GEMS.
- ELEMNT will be used to reflect the Initiation, Change and Disposition of domestic and foreign companies and will enforce strict policies to approve/recognize any changes before being uploaded into the system of record, GEMS.

Responsibilities:

- Involved in all phases of the life cycle of the project including requirement study, design, development, deployment and testing.
- Involved in .Net Core migration efforts.
- Created web-based user interface with .NET Core MVC and Web API.
- Designed and Developed application logic and used Hangfire to manage background jobs and SSIS to trigger event base emails.

- Writing unit test code coverage using xUnit and Moq.
- Supported production deployment and troubleshooting production defects.
- Took ownership to manage the complete release activity.
- Worked from scratch on most of the feature modules as individual contributors.

Environment: Visual Studio 2022, .Net core MVC, MS SQL Server 2019, .Net Core Web API, Hangfire library, Jira, Jenkin, TFS, PCF, Git, UDeploy, Sonarqube, Checkmarks.

Project: TradeOEM (Trade Open Ended Memo)

Client: Citi Bank

Role: Application Developer

Duration: Jan'21 to Mar'22

Description: This project mainly focuses on building a portal that will enable end to end process through which Open Ended Memo can be created, reviewed, approved, monitored and managed effectively within the system addressing many of the challenges currently impacting Open Ended Memo Process. The functional solution involves establishing an end-to-end process for managing Open Ended Memo documentation. This involves the definition of a template structure, providing an intuitive user interface to allow seamless authoring of Open-Ended Memo documentation in a collaborative manner, managing feedback and trigger approvals using workflows. Further the functional solution will allow for establishing Open Ended Memo review process annually and interim review in subsequent year if there are no significant changes to the previous year's submission.

The objective of the project is to:

- Digitize the creation, review, approval, monitoring and tracking of Open-Ended Memo created across all country withing ICG Risk and business Units.
- Encourages more concise and focused analysis of Open-Ended undertakings in a given market that highlights key information and metrics up-front for decision makers.
- Also ensures all policy requirements are included in the portal as applicable.

Responsibilities:

- Involved in all phases of the life cycle of the project including requirement study, design, development, and deployment and testing.
- Involved in Architecture Designing of a web-based solution.
- Created web-based user interface with ASP.NET MVC
- Designed and Developed application logic in batch jobs to trigger event base emails to end users.
- Writing stored procedures for MS-SQL Server 2017.
- Used CKEditor control to create documents.
- Trained new team members on application and framework

Environment: Visual Studio 2019, .Net MVC 5, C3.js, CKEditor, Aspose library, MS SQL Server 2017, Jira, TeamCity, Udeploy, Bitbucket, Sonarqube.

Project: PART (Post Allegation Review Tool)

Client: Wells Fargo (USA)

Role: Application Developer

Duration: May'20 to Dec'20

Description: Post Allegation Review Tool was created in response to regulatory guidelines and is designed to provide a scalable and document storage system that streamlines and supports Customer impact and Root Cause Analysis processes. Must satisfy the requirement that Wells Fargo has responded to their concerns with sustainable and measurable processes to include data security, audit/compliance tracking, record retention, reporting and establish SLAs. Ultimately streamlining processes between Customer impact and Root Cause where possible.

The objective of the project is to:

- Provide ability to incorporate all of today's current day business processes and procedures into a technical solution preventing manual process required today in a timely fashion to deliver the new application.
- The ability to connect to EAP which is a source system responsible for records to receive and transmit data to and from PART.
- Ability to connect to CMIRP for reporting purposes.

Responsibilities:

- Involved in some phases of the life cycle of the project including requirement study, design, development, and deployment.
- Responsible for application programming and implementation of identified and consigned software components in CI and RC module of PART.
- Requirement gathering, analysis and estimation by coordinating with clients.
- Timely interaction/follow up with technology analysts, business team and technology team to discuss and clarify implementation issues.
- Evaluating deliverables against business requirements.

- Implemented Unit Test code coverage for Angular using Jasmin and karma, .Net core API using XUnit and Moq Mocking Framework and database objects using SSDT.

Environment: Visual Studio 2017, .Net core 2 API, Angular 9, Kendo UI, MS SQL Server 2017, Jasmin, Karma, Jira.

Project: EAP (Enterprise Allegations Platform)

Client: Wells Fargo (USA)

Role: Application Developer

Duration: June'19 to May'20

Description: The Enterprise Allegation Platform (EAP) is designed to establish an integrated core and common case management system to support allegations across the enterprise supported by allegations policy and taxonomy, while adhering to applicable legal and regulatory requirements. It provides consistent Business Processes to handle allegations across the enterprise.

The objective of the project is to:

- Implement an enterprise allegation management system for end-to-end tracking of cases through defined lifecycle (Case Initiation, research, investigation, disposition, and the completion of the final Line of Business corrective action).
- Define Master Data elements as required to support allegations case management system functionality.
- Develop and implement allegation taxonomy supporting case management, analytics, reporting and associated interfaces.
- Develop and implement an enterprise allegation policy that supports the organization's Code of Ethics and Business Conduct in coordination with the complaints Policy.
- Implement/Modify, as needed, allegations process(s) and procedure(s) within organization LOB and Enterprise Staff Group (ESG) to align with allegation policy, allegation taxonomy and enterprise case management system.

Responsibilities:

- Involved in some phases of the life cycle of the project including requirement study, design, development, and deployment.
- Responsible for application programming and implementation of identified and consigned software components in SSCOT module of EAP.
- Requirement gathering, analysis and estimation by coordinating with clients.
- Timely interaction/follow up with technology analysts, business team and technology team to discuss and clarify implementation issues.
- Evaluating deliverables against business requirements.

Environment: .NET Framework 4.5, Visual Studio 2017, Web API, Angular, Kendo UI, MS SQL Server 2016.
