PROFESSIONAL SUMMARY

- Over 11 years of solid experience in project development, testing, deployment, and maintenance of big data applications using Azure services and Azure DevOps, skilled in designing and implementing data analytical solutions, optimizing data infrastructures, ensuring high performance and reliability, proven ability to manage complex data workflows and enhance business intelligence initiatives through advanced analytics and data insights.
- Hands-on experience in Azure cloud, worked on Azure Data factory, Azure Databricks, Azure App services, Azure SQL Database, Azure Blob storage, Azure Data Lake Gen2, Azure Synapse Analytics, Azure Functions, Azure Storage, Azure Virtual machines, Azure Active Directory, Azure key Vault, Azure event hub, Azure Data Lake Analytics, Azure DevOps, Azure Cosmos DB.
- Proficient in building ETL pipelines using Azure Data Factory for incremental loads from various databases (SQL Server, Azure SQL DB, MySQL, PostgreSQL, MongoDB, Cassandra) to Azure Synapse Analytics, utilizing Zero Copy Cloning, Time Travel, DBT, PySpark, and Unity Catalog for efficient data management, historical tracking, transformation, and governance.
- Mastered in integrating CDC (Change data capture) with big data technologies and Azure services to ensure real-time data updates and synchronization and managing Slowly Changing Dimensions (SCD) to manage and track historical data changes in Enterprise data warehouses (EDW).
- Pioneered the design and implementation of data warehousing solutions using Azure Synapse Analytics, mastering SQL-based integration pipelines with activities like Data Copy, Notebooks, and Stored Procedures, while leveraging MS Fabric for microservices orchestration, ensuring scalability and high availability in data workflows.
- Optimized scalable data processing workflows in Azure Databricks using PySpark and Spark-SQL, specializing in data cleaning and transformation, managed Databricks clusters, workspaces, and job scheduling, leveraged Azure Blob Storage for data storage and access, and used DBT for modular data transformations and managing model dependencies.
- Expert in advanced analytics using Scala, Python, and PySpark to build robust data pipelines, leveraging Delta Lake within Azure Data Lake Storage and Azure Databricks for data versioning, reliability, and efficient access, while utilizing SQL Analytics for real-time insights and implementing Delta Live Tables for automated data transformations and quality enforcement.
- Orchestrated data movement and transformations using Azure Data Factory, integrating processed data into Azure Synapse Analytics for warehousing and analytics, while leveraging Azure DevOps, MS Fabric, Blob Storage, Data Catalog, and Databricks with Delta Live Tables for efficient data governance, microservices orchestration, and real-time updates.
- Well-versed in managing and configuring Azure Active Directory (Entra ID) for secure identity and access management, expertise in setting up and administering user roles, groups, and permissions, as well as integrating Entra ID with various Azure services and leveraging Azure Data Catalog for efficient data discovery, classification, and metadata management across the organization.
- Experienced in automating event-based workflows with Azure Logic Apps and Functions, integrating security with Entra ID, and managing data warehousing solutions using Azure Synapse Analytics for data ingestion and transformation.
- Skilled in managing Azure Key Vault for secure data storage, implementing Role-Based Access Control (RBAC), and using Unity Catalog in Azure Databricks for data governance and security, integrated with Azure DevOps for automated deployment.
- Proficient in developing and optimizing large-scale data processing pipelines using PySpark on Azure Databricks, implementing complex transformations, aggregations, and joins across distributed datasets, ensuring high performance and scalability for data processing tasks.
- Automated infrastructure and application deployments in Azure using ARM templates and Azure DevOps CI/CD pipeline, streamlined build, test, and deployment processes for efficient and reliable delivery of cloud resources and applications.
- Leveraged shell scripting for efficient data processing, system monitoring, and task automation on Azure VMs and Azure Storage. Integrated scripts with Azure services (Azure Data Factory, Azure Kubernetes Service and Azure Databricks) to orchestrate data pipelines, manage Azure Data Lake storage, and automate workflows, enhancing operational efficiency.
- Experienced in developing large-scale data pipelines using PySpark and Hive, with hands-on expertise in Kafka and Flume for loading log data into HDFS, leveraging MapReduce for distributed processing, filtering, and aggregation, and applying parallel processing techniques in Apache Spark using Scala and PySpark to efficiently handle Big Data.
- Expert in designing Hive external tables with a shared meta-store, implementing partitioning, bucketing, and indexing, and optimizing Hadoop algorithms using Spark, Spark-SQL, DataFrames, and RDDs, with hands-on experience in Spark performance tuning on Azure Databricks.
- Worked on third-party data exchange projects, implementing and optimizing data pipelines using standards to ensure seamless healthcare data integration and interoperability.
- Proficient in using Apache Flink for real-time stream processing and batch processing in big data applications, experienced in orchestrating and managing Flink workflows using Apache Airflow to ensure efficient scheduling, execution, and monitoring of data pipelines skilled in optimizing performance and reliability of Flink jobs while integrating data sources.
- Optimized large-scale data processing workflows by enhancing HDFS, Spark, and Yarn configurations, applying techniques like data partitioning, in-memory caching, and parallel processing, and leveraging Hadoop components (HDFS, Spark, Yarn, Pig, Hive, Oozie) with triggers to automate and streamline data processing.

- Experienced in database architecture for OLAP and OLTP applications, specializing in database design, data migration, ETL, and large-scale data transformations, with expertise in integrating Teradata solutions for efficient and scalable data warehousing and analytics across diverse systems.
- Skilled in Star and Snowflake schema modeling, FACT & Dimension table design, and data modeling (dimensional, relational, NoSQL) for scalable architectures.expertise in Teradata for high-performance warehousing, Snowpipes for real-time ingestion, and SnowSQL for cloud-based querying.
- Competent in using TSQL and PL/SQL for data querying, manipulation, and management in large-scale databases and optimizing complex SQL queries for performance and efficiency and mastered in designing and maintaining database schemas, ensuring data integrity.
- Strong expertise across various file formats like Avro, Parquet, Sequence, JSON, ORC, text for loading data, parsing, gathering, and performing transformations, leveraged YAML for data configuration and workflow management, including integration with NoSQL data stores for efficient data processing.
- Skilled in using Python libraries (Pandas, NumPy, TensorFlow, MLflow, PySpark) for data processing, analysis, and automation, with expertise in data profiling, exploratory data analysis (EDA), and integrating AI/ML models into data pipelines to optimize and automate workflows.
- Proficient in using Power BI for creating interactive dashboards and data visualizations, utilizing Power Query to shape and clean data, enabling robust data models built with DAX for advanced analysis.
- Specialized in defining user stories and managing agile boards in JIRA, actively participating in sprint demos and retrospectives, ensuring smooth execution of Agile methodology throughout the project lifecycle, skilled in GIT and GitHub Enterprise for version control, and proficient in setting up CI/CD pipelines with Jenkins, using Terraform for infrastructure, and deploying containerized applications with Docker and Kubernetes.

TECHNICAL SKILLS

Azure Technologies

Azure Data Factory (ADF), Azure Synapse Analytics, Azure Event Hub, Poly Base, Azure SQL Server, Azure Stream Analytics, Azure Data Lake GEN2, Azure Logic Apps, Azure Functional Apps, Azure Blob Storage, Azure Databricks, Azure Virtual Machines, Azure Data Lake Analytics, Azure Active Directory, Azure Data Catalog, Azure Monitor, Azure Purview, Azure Cosmos DB, Azure Key Vault, Azure DevOps, Azure HDInsight, Azure Log Analytics, Azure Service Bus, Azure Resource Manager Templates, Azure Application Insights, Azure CLI

Big Data Technologies

Hadoop, HDFS, MapReduce, Yarn, Spark, Sqoop, Hive, Pig, HBase, Flume, Kafka, Performance Tuning, Oozie, Zookeeper, Snowflake

Databases

Oracle, MySQL, MSSQL, SQL Server, MongoDB, Cassandra, Sybase, PostgreSQL, Teradata, DB2

Programming Languages

Python, PySpark, Shell script, Scala, R, SQL, PL/SQL, TSQL

Automation Technologies

Jenkins, Terraform, Docker, Kubernetes, Apache Airflow, GitLab CI/CD, Informatica, SSRS

Tools

PyCharm, Eclipse, Visual Studio, SQL Developer, SQL Navigator, SQL Server Management Studio, Eclipse, Erwin, ER Studio

Version Control

SVN, Git, GitHub, Maven, bitbucket, GitLab

Visualization/Reporting

Tableau, Power BI

File Format

ORC, Parquet, Avro, JSON, DELIMITED (CSV), XML, TXT, Excel

PROFESSIONAL EXPERIENCE

Client: CISCO, Milpitas, California

Jun 2022 to till now

Role: Senior Azure Data Engineer

Responsibilities:

- Designed and deployed end-to-end data pipelines using Azure services like Azure Data Factory, Logic Apps, and IoT Hubs to process network data for 5G mobile networks, ensuring scalability for high-volume data streams from telecom infrastructure.
- Developed Jenkins jobs and pipelines for version control integration, automated testing, and deployment to Azure Data Factory, optimized data transformations using Azure Databricks and Azure SQL Database, and orchestrated complex data pipelines with Apache Airflow and Databricks Jobs for task automation and scheduling.
- Ensured the data lake architecture was scalable to accommodate the ever-growing volume and variety of data from sources and implemented robust security measures within ADLS Gen2 to safeguard sensitive usage information.
- Integrated data pipelines for real-time monitoring and processing of VoIP data from multiple sources (CSV, JSON, CDR files), ensuring streamlined ingestion, quality control, and high-performance service delivery.
- Designed SQL-based data integration workflows to consolidate data from diverse sources (MS SQL Server, Azure SQL DB, MySQL, PostgreSQL, MongoDB) into Azure Data Lake, leveraging Informatica for ETL and optimizing data processing with T-SQL, PL/SQL, and advanced SQL techniques.
- Utilized best practices in data modeling to optimize query performance and facilitate easy integration with various data sources such as MySQL, MongoDB, NoSQL, Cassandra, and these data models enabled efficient storage, retrieval, and analysis of data.

- Ensured data quality, security, and compliance using Azure Purview, automated security checks with shell scripts, managed data encryption, and leveraged Docker for containerizing data pipelines, processing scripts, and microservices for scalable deployment.
- Integrated Apache Kafka for real-time data streaming, utilizing its topics, partitions, and consumer groups for consistency, scalability, and high availability, while employing MapReduce for distributed batch processing and aggregation of Kafka-streamed data, and automating cloud infrastructure provisioning and management for the data pipeline using Terraform.
- Employed activities such as Lookups, Stored Procedures, If Condition, For Each, Set Variable, Append Variable, Get Metadata, and Filter, administered and optimized MS SQL Server databases for performance optimization and reliability, configured Azure Data Factory Triggers, scheduled pipelines, and set up alerts for failure notifications.
- Designed and implemented real-time data processing pipelines using Azure Stream Analytics with Azure Event Hubs as the data source, leveraging PySpark in Azure Databricks to process streaming data, utilizing DAGs to orchestrate complex data workflows, leveraging Spark and Spark SQL.
- Configured Azure Logic Apps to handle email notifications using web services activities, implemented triggers to initiate workflows based on conditions like new records in Azure SQL Database or changes in Azure Blob Storage, ensuring timely communication based on real-time events.
- Used Azure Databricks with Delta Live Tables(DLT) for scalable, ACID-compliant storage, automated data processing with PySpark, and implemented SQL Analytics for advanced data solutions, while using Azure Key Vaults for centralized data governance and efficient pipeline management.
- Performed Continuous Integration and Continuous Deployment (CI/CD) pipelines using Azure DevOps to automate the deployment of data pipeline components, leveraging MS Fabric for scalable microservices orchestration, and implemented Infrastructure as Code (IaC) using ARM (Azure Resource Manager) template.
- Exposed transformed data in Azure Databricks using PySpark to Parquet formats for efficient data storage, enabling seamless collaboration and code sharing among team members within the Databricks workspace, leveraged Azure Databricks and PySpark to deploy Azure Data Lake Analytics, implementing SCD-1 and SCD-2 approaches.
- Developed Spark applications using PySpark, Spark SQL, and Scala for data extraction, transformation, and aggregation from Azure Data Lake, leveraging MapReduce for distributed processing and Apache Flink for streaming data analysis, while optimizing resource allocation and job scheduling with Yarn in Spark clusters for efficient execution of large-scale data pipelines.
- Leveraged Azure Cosmos DB for seamless integration with Azure services like Azure Functions, Azure Storage, Azure Logic Apps, and Azure Data Factory, configuring triggers in Azure Functions for real-time data processing and ensuring optimized synchronization, availability, consistency, and security across services.
- Optimized data processing workflows in Azure Databricks by implementing efficient PySpark transformations, Spark performance tuning, and MapReduce for distributed processing, achieving a 30% reduction in processing time for large datasets, while managing Spark job execution and resource allocation with Yarn to ensure scalability, reliability, and optimal resource consumption.
- Integrated Azure Databricks with Azure Machine Learning to deploy and operationalize machine learning models directly within the Databricks environment, automated model training, evaluation, and deployment pipelines, ensuring seamless end-to-end machine learning workflows while maintaining scalability and performance.
- Designed and implemented an Enterprise Data Warehouse (EDW) using Azure Synapse Analytics and MS Fabric, leveraging PolyBase for efficient external queries and optimizing execution plans, reducing query response times by 40%.
- Optimized large-scale data processing in Azure Databricks by utilizing Delta Lake to ensure data consistency and high-performance updates in real-time streaming scenarios, implemented time travel features to provide reliable access to historical data versions, enhancing the data auditing and troubleshooting processes across data pipelines.
- Implemented Unity Catalog in Azure Databricks to enable centralized data governance, fine-grained access control, and secure data sharing across workspaces, ensuring compliance with enterprise security policies while improving data discovery and management.
- Utilized pull requests on GitHub to propose code changes, collaborate with teammates, and facilitate code review, led the adoption of Agile methodology, facilitating sprint planning, daily stand-ups, and sprint reviews to ensure iterative development and rapid feature delivery, collaborated with cross-functional teams to prioritize tasks, manage backlogs, conducted regular project presentations.

Environment: Azure Data Factory, Azure Data Lake Gen 2, Azure Databricks, PySpark, Spark SQL, Azure Synapse Analytics, Azure Functions, Azure Notification Hubs, Azure Active Directory, Delta Live Tables, Unity Catalog, Power BI.

Client: Seagate Technology, Fremont, California

Jan 2018 – Jun 2022

Role: Data Engineer

Responsibilities:

- Designed and implemented tabular models on Azure Analysis Services to empower stakeholders with interactive dashboards and reports in Power BI, facilitating data-driven decision-making in critical financial areas, built complex ETL pipelines using Azure Data Factory (ADF) with mapping data flows for efficient data transformation of financial data sets (e.g., customer transactions, market data).
- Used Power BI dashboards and advanced SQL techniques to visualize and interpret manufacturing and supply chain data, providing decision-makers with actionable insights on inventory management and logistics.
- Streamlined the flow of manufacturing data, including sensor data from SCADA systems, into Azure Data Lake Storage Gen2 for robust analytics on supply chain efficiency, using tools like Azure Databricks and Azure SQL Database for transformation and storage.
- Utilized Kubernetes features such as auto-scaling, rolling updates, and self-healing to maintain system performance and minimize downtime, built a common SFTP download using Azure Data Factory, and developed Azure Databricks ETL pipelines with Spark DataFrames, Spark SQL, PySpark and Python scripting.

- Used Azure Key Vault for secret management in Azure Data Factory and Databricks notebooks, designed and deployed Azure Function Apps for automating data processing tasks, and integrated Unity Catalog in Azure Databricks to enforce data governance policies, ensuring centralized access control, data lineage, and compliance.
- Led ETL processes for data warehousing, including data cleaning and building pipelines with Azure Data Factory and PySpark, optimized T-SQL queries and data models in Azure Databricks SQL Analytics for accurate and efficient querying, and used DBT for transforming raw data into structured models for downstream analytics and reporting.
- Designed and executed cloud migration strategies using Azure Databricks and PySpark, leveraging Delta Lake and Auto Loader for efficient data processing, optimizing Spark jobs and clusters, and enforcing access control with Unity Catalog.
- Established data governance frameworks by implementing Azure Purview for enterprise-wide data discovery, lineage tracking, and classification, ensuring compliance and effective metadata management, integrated Azure Purview with Azure Synapse Analytics and Azure Data Factory to enhance data cataloging, improve governance policies, and maintained data quality across ETL pipelines.
- Designed and deployed Kafka topics and clusters to ingest, buffer, and distribute real-time data from on-prem sources to downstream analytics platforms, utilizing MapReduce for distributed processing and aggregation of large-scale data before feeding it into PySpark and Azure Synapse Analytics for further analysis.
- Designed and executed an Enterprise Data Warehouse (EDW) using Azure Synapse Analytics to consolidate and manage data from multiple sources, ensuring seamless data integration and governance, achieving a 35% improvement in query performance, implemented Terraform scripts to enforce infrastructure compliance and best practices across the data pipeline.
- Created Azure Databricks Job workflows using PySpark and Python to extract data from SQL Server, upload files to SFTP, and leverage Delta Lake for large-scale ingestion, data versioning, and updates, while incorporating Delta Live Tables for automated pipeline management and utilizing Databricks Jobs for scheduling and automating recurring tasks.
- Deployed and managed Azure HDInsight clusters for scalable big data processing using Apache Hadoop, Spark, and Hive, leveraging YARN for efficient resource management, job scheduling, and dynamic scaling.
- Implemented Azure Service Bus for secure messaging and integration, managed message queues for asynchronous processing, and integrated Azure Active Directory (Entra ID) for secure authentication and role-based access control.
- Enhanced data storage efficiency and retrieval speed within the EDW (Enterprise Data Warehouse) using Azure Synapse Analytics by leveraging features such as partitioning, indexing, materialized views, and query optimization, utilized PolyBase for seamless data integration and performed advanced performance tuning to support high-volume data processing and analytics.
- Created Docker images to ensure consistent environments across development, testing, and production stages, developed Spark applications using Spark-SQL for data extraction, transformation, and aggregation from multiple file formats.
- Optimized PySpark job performance in Azure by estimating cluster size, monitoring, and troubleshooting, leveraging MapReduce for distributed processing, achieving a 40% efficiency gain, and enhancing Spark performance with Scala and Spark-SQL streaming.
- Spearheaded data integration efforts by developing and managing ETL processes using DBT to transform raw data into clean, analytics-ready datasets to seamlessly integrate data from diverse sources into a unified data platform and implemented DAGs to schedule and monitor tasks, optimized workflow performance and integrated Airflow with various data sources.
- Responsible for building and scaling ETL and event processing systems that organize data and manage complex rule sets in batch and real-time and involved in Branching, Tagging and Release Activities on GitHub Version Control.
- Applied Agile methodology with Scrum for iterative development, prioritized tasks in sprints, participated in sprint planning, stand-ups, and retrospectives for continuous improvement, and collaborated with cross-functional teams to align goals, prioritize backlogs, and adapt to evolving business needs.

Environment: Azure Data Factory, Azure DevOps, Jenkins, Azure IoT Hub, Azure Databricks, PySpark, Azure BLOB Storage, Azure Synapse Analytics, Azure Data Lake Storage Gen2, Azure Data Catalog, Azure Purview, SQL Server, HDFS, MapReduce, YARN, Spark, Hive, SQL, Python, Scala, Unity Catalog.

Client: VERIZON, Irving, Texas

Oct 2015 - Jan 2018

Role: Data Analyst

Responsibilities:

- Designed enterprise-level data models using ERD and dimensional modeling for OLTP and OLAP systems, developed Tableau reports for business intelligence, and automated ETL processes with SSIS to streamline data flows and enhance reporting accuracy.
- Identified, documented, and managed existing data assets, ensuring effective utilization and consistent governance across the enterprise, while enhancing OLAP reporting capabilities and optimizing NoSQL storage solutions.
- Performed data analysis, testing (Unit, Integration, UAT, Performance), and report validation across QA, Dev, and Production environments, ensuring accuracy and reliability.
- Developed SQL-based views and optimized data layers for use in Tableau dashboards and reports, enabling improved business intelligence and decision-making with special focus on OLTP systems for real-time data.
- Designed and developed Tableau dashboards using multiple data sources, including SQL Server, and Excel, leveraging calculations, filters, parameters, and data blending for enhanced insights.
- Built KPI metrics and executive-level reports to track operational performance, compliance metrics, cost productivity, and workforce planning, supporting business decision-making.
- Migrated data from relational databases (RDBMS) to NoSQL systems and transformed staging data into STAR schema, facilitating efficient data analysis and reporting.

- Managed reports migration, incident resolution, and change requests using ServiceNow, while maintaining dashboard standardization on Confluence, SharePoint, and Box.
- Involved in database performance tuning for OLTP and OLAP models, including query optimization, indexing, and fine-tuning large data imports/exports.
- Managed data integration tasks, including importing and cleansing data from various sources such as IBM Data Storage, Teradata, Oracle, flat files, and SQL Server, ensuring data consistency and quality.
- Designed and developed interactive dashboards and reports using Power BI, integrating data from multiple OLTP and OLAP systems, flat files, and Excel, enabling business users to gain actionable insights and make data-driven decisions.
- Developed complex TSQL and PL/SQL queries and stored procedures in SSMS for SQL Server and Oracle to support, reporting, and data processing tasks, ensuring robust error handling and process automation, resulting in improved data integrity and reduced errors by 30%.
- Utilized Waterfall methodology to manage project workflows, ensuring a structured and sequential development process with clear milestones, thorough planning, and well-defined requirements at each stage, collaborating with cross-functional teams to ensure timely delivery and alignment with business goals.

Environment: SQL Server, Teradata, Oracle, IBM Data Storage, NoSQL, Tableau, TSQL, PL/SQL, SSMS, Data Warehousing, Data Analysis, OLTP, OLAP.

Client: MERCURY INSURANCE, Brea, California

Jan 2014 – Oct 2015

Role: Data Modeler

Responsibilities:

- Designed and developed logical, physical, and conceptual data models using ER Studio and Erwin, capturing current and future state data elements, and business requirements, ensuring alignment with enterprise goals, and leveraging advanced data modeling techniques to improve data structure and integration across systems.
- Led data modeling and migration for data warehouses using Erwin, ensuring accurate data flow from source systems to target Datamarts, including reverse-engineering DB2 to Teradata, optimizing data structures, and automating ETL processes with SSIS.
- Developed and optimized PL/SQL statements and stored procedures in DB2 to extract and load data, ensuring data integrity and replication into the data warehouse without anomalies.
- Created and implemented Star and Snowflake dimensional models in the data warehouse, optimized query performance with data partitioning, utilized Snowflake's Zero Copy Cloning and Time Travel for data testing and historical queries, automated real-time data loading with Snowpipe, and managed performance using SnowSQL for efficient database interaction and monitoring.
- Collaborated with the ETL team to provide source-to-target mappings and explain complex data transformation logic, facilitating smooth and efficient data loads into the data mart (initial, full, and incremental).
- Managed the migration of data and data models from SQL Server to Oracle, ensuring seamless data integration and maintaining compatibility across systems.
- Created and optimized shell scripts to automate data processing tasks, manage ETL workflows, and perform system monitoring within the data warehousing environment, and utilized SSIS to further automate data loading, transformation, extraction, and validation to ensure data integrity before processing.
- Designed and implemented data warehousing solutions using Oracle Database, optimized PL/SQL scripts for ETL processes, and leveraged Python for efficient data processing workflows and integration with relational and NoSQL data sources.
- Managed end-user database maintenance requests, including adding/removing columns and tables with approval from business analysts, and used SSMS to design new database structures and conducted GAP analysis and data mapping to derive requirements for system enhancements.
- Generated logical and physical data models for Providers, payers, and member profiles using Erwin, with SQL Server and Oracle as target databases, and utilized ER Studio for data modeling.
- Developed TSQL query mechanisms for data deduplication during import into target data model tables, conducted data profiling and analysis, and established Primary and Foreign key relationships.
- Implemented third-party data exchange solutions leveraging FHIR standards to integrate and exchange healthcare data securely across platforms, ensuring compliance with industry regulations and improving interoperability between systems.
- Integrated SSRS with SQL Server and other data sources to create comprehensive data models and enable self-service business intelligence, developed automated refresh schedules and data pipelines to ensure up-to-date insights for stakeholders.
- Utilized Informatica 9.1 to design, develop, and optimize ETL workflows for data warehousing solutions and implemented complex data extraction, transformation, and loading processes to integrate data from various sources into the data warehouse, also incorporated SSIS in conjunction with Informatica to enhance ETL processes where applicable.
- Worked closely with cross-functional teams to align with business objectives and facilitated effective communication throughout data migration projects, actively participating in meetings to identify challenges and offer solutions, ensuring on-time project completion.

Environment: Oracle, DB2, Teradata, Snowflake, SQL Server databases, SSIS, FHIR Data Integration, FHIR Resource Modeling, Informatica, Snowpipe, ER Studio and Erwin

EDUCATION

- Bachelor of Computer Science, Visvesvaraya Technological University
- Master of Computer Science, California State University, East Bay

CERTIFICATIONS

- AZ-900 Microsoft Azure Fundamentals
- DP-203 Microsoft Azure Data Engineer Associate
- Databricks Certified Data Engineer Associate
