

Vignesh Mandli - Software Engineer

vigneshym1206@gmail.com | +1 (720) 593-9753

PROFESSIONAL SUMMARY

Highly experienced Software Engineer with over 5 years of expertise in full lifecycle involvement, adept at analyzing business requirements, performing gap analysis, and designing robust application solutions. Proven success in designing, developing, and implementing enterprise applications leveraging Core J2EE and modern open-source Java frameworks including Spring Boot, Spring WebFlux, Struts, Hibernate, and JPA. Expert in developing and maintaining both front-end and back-end components, ensuring seamless integration and optimal user experience through responsive web interfaces built with Angular, React.js, HTML5, CSS3, and Bootstrap. Skilled in integrating with SOAP and RESTful web services, architecting cloud-native solutions on AWS and Azure, and driving CI/CD pipelines with Docker, Kubernetes, Jenkins, and GitHub Actions. Recognized for collaborating effectively with business analysts and clients to gather requirements, provide technical specifications, lead multiple application releases, mentor junior developers, and enforce stringent code standards and best practices within Agile environments.

SKILLS

Programming Languages: Java, Python, JavaScript, TypeScript

Java Frameworks & Technologies: Spring Boot, Core J2EE, Spring WebFlux, Hibernate, Struts, JPA, Spring Security, REST APIs, SOAP/WSDL

Front-End Development: HTML5, CSS3, JavaScript, TypeScript, Angular, React.js, Bootstrap

Cloud Platforms: AWS (EC2, ECS, Lambda, S3, RDS, DynamoDB, API Gateway, CloudFront, CloudWatch), Azure (App Service, Azure SQL)

Microservices & Messaging: Kafka, RabbitMQ

Database Management & Search: PostgreSQL, MongoDB, DynamoDB, Elasticsearch

CI/CD & DevOps: Docker, Kubernetes, Jenkins, GitHub Actions

Build & Quality Tools: Maven, Gradle, SonarQube, JUnit 5, Mockito, Jasmine, Karma, Cucumber BDD, JMeter

Monitoring & Observability: Prometheus, Grafana, ELK Stack (Elasticsearch, Logstash, Kibana), Log4J

Version Control & Collaboration: Git, GitHub, Bitbucket, Jira, Confluence

Architectural & Design Patterns: Factory, Singleton, Data Access Object (DAO), Business Delegate

EXPERIENCE

Senior Software Engineer @ Candid Health, San Francisco, CA

May 2024 – Present

- Designed and developed a Spring Boot REST API for enterprise applications, handling 1,000 requests daily and reducing response time by 20%.
- Implemented Core J2EE Design Patterns such as Business Delegate and Data Access Objects (DAO) for robust business tier development.
- Developed responsive Angular and Bootstrap components, enhancing mobile responsiveness by 18% for critical enterprise portals.
- Built and maintained over 3 Spring Boot microservices to improve API response times and boost scalability for high-traffic applications.
- Secured microservices using JWT authentication and Keycloak Role-Based Access Control, consistently passing all security audits.
- Established a containerized Kubernetes deployment pipeline with Docker and GitHub Actions, enabling blue-green deployments with zero downtime.
- Designed event-driven services using Apache Kafka and Spring WebFlux, supporting real-time order tracking for 50,000+ concurrent users.
- Managed dependency versions with Gradle, implementing build caching that significantly reduced local build times by over 60%.

- Created advanced analytics dashboards using Grafana and Prometheus, providing live service health insights and reducing mean time to detect by 40%.
- Integrated Elasticsearch for advanced search features, decreasing query times from 2 seconds to under 500ms for improved user experience.

Environment: Java, Spring Boot, Spring WebFlux, Core J2EE, Hibernate, Angular, Bootstrap, REST APIs, Kafka, Keycloak, JWT, Gradle, Elasticsearch, Docker, Kubernetes, GitHub Actions, Prometheus, Grafana, Log4J, JUnit 5, Mockito, AWS (EC2, ECS, Lambda, S3, RDS, DynamoDB, API Gateway, CloudFront, CloudWatch), Git, Jira, Confluence

Full Stack Engineer @ Capital One, McLean, VA

Sep 2021 – Aug 2023

- Led the migration of enterprise applications from Java 11 to Spring Boot 3.x / Java 17, modernizing codebases and improving performance.
- Designed microservices using Spring Boot, Java, and Hibernate ORM, achieving 35% faster database access compared to previous monolithic architectures.
- Created interactive Angular dashboards powered by RESTful APIs, reducing manual sales trend reporting time for business analysts by half.
- Secured microservices with JWT and Keycloak role-based access control, ensuring compliance with all internal security requirements.
- Documented REST APIs comprehensively with Swagger/OpenAPI, significantly reducing the onboarding time for new development team members.
- Migrated product catalog storage to MongoDB, enabling flexible schema design that accelerated new feature development by 20%.
- Configured Maven multi-module builds to streamline deployments and integrated SonarQube for continuous code quality and vulnerability checks.
- Built unit and integration test suites in Angular using Jasmine and Karma, increasing front-end test coverage and application stability.
- Conducted Cucumber BDD testing sessions with stakeholders, transforming acceptance criteria into automated end-to-end tests for faster cycles.
- Utilized RabbitMQ to queue batch processing jobs, spreading execution over off-peak hours and lowering system load during business operations.

Environment: Java, Spring Boot, Hibernate ORM, Angular, REST APIs, Keycloak, JWT, Maven, MongoDB, RabbitMQ, Swagger/OpenAPI, SonarQube, Jasmine, Karma, Cucumber BDD, Prometheus, Grafana, AWS (S3, EC2, ECS), Bitbucket, Jira, Confluence

Software Engineer @ Target, Minneapolis, MN

May 2019 – Aug 2021

- Exposed and consumed web services using WSDL over HTTP transport protocol, facilitating robust communication using SOAP.
- Built responsive web applications using HTML5, CSS3, TypeScript, and React.js components, improving page load speed by 15% and enhancing user engagement.
- Integrated Spring Framework with both Hibernate and Struts applications using Inversion of Control (IoC) principles for modular design.
- Containerized a Java web application using Docker and implemented a Jenkins CI/CD pipeline, reducing deployment time from 30 minutes to under 5 minutes.
- Applied Factory and Singleton design patterns in backend modules, reducing duplicate code by 25% and significantly improving maintainability.
- Configured Maven build scripts with profile-based deployments, accelerating build and packaging time by 30% in development environments.
- Created JUnit 5 and Mockito test suites achieving 80% code coverage, leading to fewer production bugs and faster quality assurance cycles.
- Designed optimized queries in PostgreSQL and mapped them via Hibernate, improving data fetch operations by 40% in key application endpoints.
- Implemented centralized logging with the ELK Stack (Elasticsearch, Logstash, Kibana), enabling real-time troubleshooting and log visualization.

- Deployed a proof-of-concept system to Azure App Service with Azure SQL, enabling rapid feature demonstrations to clients without impacting production.

Environment: Java, Core J2EE, Spring Framework, Struts, Hibernate, REST APIs, SOAP/WSDL, HTML5, CSS3, TypeScript, React.js, Docker, Jenkins, Maven, PostgreSQL, ELK Stack (Elasticsearch, Logstash, Kibana), Azure (App Service, Azure SQL), JMeter, SonarQube, JUnit 5, Mockito, Jira

EDUCATION

Master's in Information Systems @ Lindsey Wilson University
